

Important notices

1. The technical data presented in this Anchor Fastening Technology Manual is based on numerous tests and evaluation criteria according to the current state-of-the-art and the relevant European regulations.
2. For all those anchors holding a European Technical Assessment (ETA), noted in the cover with the respective icon, the technical data given in this manual is based and in accordance with the information given in the respective ETA. Additional Hilti technical data, supplementing the ETA technical data, may be available, in which case, it will be clearly noted on footnotes and/or tables.
3. For all those anchors not holding an ETA, the technical data given in this manual is based on numerous tests and evaluation criteria according to the current state-of-the-art and/or the relevant European applicable regulations for the assessment of fasteners, which is the basis for obtaining an ETA.
4. In addition to the tests for standard service conditions (including, in some cases, seismic as an option), fire resistance, shock and fatigue tests may have been performed – see respective reports for full details.
5. The data and values are based on the respective average values obtained from tests under laboratory or other controlled conditions, or on generally-accepted methodology. It is the responsibility of the customer to use the data given in the light of conditions on site and taking into account the intended use of the products concerned. The customer must check the listed prerequisites and criteria conform with the conditions actually existing on the job-site. Whilst Hilti can give general guidance and advice, the nature of Hilti products means that the ultimate responsibility for selecting the right product for a particular application must lie with the customer.
6. The given technical data in the Anchor Fastening Technology Manual is valid only for the indicated test conditions. Due to variations in local base materials, on-site testing maybe required to determine performance at any specific jobsite.
7. Technical data presented herein was current as of the date of publication (see back cover). Hilti's policy is one of continuous development. We therefore reserve the right to alter technical data and specifications, etc. without notice.
8. Construction materials and conditions vary on different sites. If it is suspected that the base material has insufficient strength to achieve a suitable fastening, contact the Technical Competence Center of your local Hilti organization.
9. All products must be used, handled and applied strictly in accordance with all current instructions for use published by Hilti, i.e. technical instructions, operating manuals, setting instructions, installation manuals and others.
10. All products are supplied and advice is given subject to the local Hilti organization terms of business.
11. While reasonable measures have been taken to provide accurate information, no warranty is provided that it is without error. Hilti shall in no event be obligated for direct, indirect, incidental, consequential, or any other damages, losses or expenses in connection with, or by reason of, the use of, or inability to use, the products or information for any purpose. Implied warranties of merchantability and fitness for a particular purpose are specially excluded.

Design of fastenings in concrete: Eurocode 2 Part 4 (EN 1992-4)

A new anchor design standard to improve efficiency, consistency and safety in construction is available now. What are the differences and similarities between Eurocode 2 Part 4 and ETAG 001?

Guidelines are used as a temporary solution in the absence of an official standard for a specific application or product. Standards supersede relevant guidelines and technical reports when they are officially published. Whereas standards are mandatory documents to be complied with, guidelines are treated more like a recommendation. However, they both have similar purposes, which is helping to avoid:

- Anchor failures that may lead to partial or total collapse of structures
- Possible casualties and economic loss due to improper anchor design

On the other hand, they also have certain differences:

| ETAG 001 | EUROCODE 2 PART 4 (EN 1992-4) |
|--|--|
| Is a guideline and recommendation on how to design post-installed anchors. | Is a legitimate document when designing anchor channels, cast-in anchors and post installed fastenings. |
| Is only available in English. | Will have local language versions in each CEN accredited country. |
| Has limited updates. | Will be supported with national annexes published by local governmental entities. |
| Creates limited awareness as a non-mandatory document. | Creates high awareness for cracked concrete usage as an international standard. |
| No definition for specification details and proper anchor selection on the jobsite. | Defines how to specify anchors and which steps to follow on the jobsite enabling proper anchor selection and installation. |
| Has no information about creep behavior of bonded fasteners under sustained loading. | Has concise information regarding how to design bonded fasteners under sustained loading. |

Hilti has already implemented Eurocode 2's new section for the design of concrete fastenings (Part 4) into our PROFIS Engineering software together with the updated ETAs (European Technical Approvals), allowing engineers to design according to the new standard and making fastening design easier and safer.

For more information you can reach out to your local Hilti Engineering Team.

Resistance under fire exposure

Testing conditions

Tested in cracked concrete and exposed to flames from one side without insulating or protective measures.

In case of fire attack from more than one side, the minimum edge distance shall be ≥ 300 mm.

In case of wet concrete $h_{ef}+30$ mm

ISO Curve

The ISO curve (ISO 834), also called the standard fire temperature curve, is the thermal stress generally applied in component analyses/tests in the building industry.

ZTV-ING Curve

The ZTV-ING curve applies to road tunnels in Germany regardless of their design and the type of traffic.

- = expected lifetime of anchors made from this material is typically satisfactory in the specified environment based on the typically expected lifetime of a building. The assumed service life in ETA approvals for powder-actuated and screw fasteners is 25 years, and for concrete anchors it is 50 years.
- = a decrease in the expected lifetime of non-stainless fasteners in these atmospheres must be taken into account (≤ 25 years). Higher expected lifetime needs a specific assessment.
- = fasteners made from this material are not suitable in the specified environment. Exceptions need a specific assessment.

* From a technical point of view, HDG/duplex coatings and A2/304 material are suitable for outdoor environments with certain lifetime and application restrictions. This is based on longterm experience with these materials as reflected e.g. in the corrosion rates for Zn given in the ISO 9224:2012 (corrosivity categories, C-classes), the selection table for stainless steel grades given in the national technical approval issued by the DIBt Z.30.3-6 (April 2009) or the ICC-ES evaluation reports for our KB-TZ anchors for North America (e.g. ESR-1917, May 2013). The use of those materials in outdoor environments however is currently not covered by the European Technical Approval (ETA) of anchors, where it is stated that anchors made of galvanized carbon steel or stainless steel grade A2 may only be used in structures subject to dry indoor conditions, based on an assumed working life of the anchor of 50 years.

Environment categories

Applications can be classified into various environmental categories, by taking the following factors into account:

| Indoor applications | |
|---|--|
|  | Dry indoor environments (Heated or air-conditioning areas) without condensation, e.g. office buildings, schools. |
|  | Indoor environments with temporary condensation (Unheated areas without pollutant) e.g. storage sheds |

| Outdoor applications | |
|---|--|
|  | Outdoor, rural or urban environment with low population Large distance (> 10 km) from the sea |
|  | Outdoor, rural or urban environment with moderate concentration of pollutants and/or salt from sea water Distance from the sea 1-10 km |
|  | Coastal areas Distance from sea <1 km |
|  | Outdoor areas with heavy industrial pollution Close to plants < 1 km (e.g. petrochemical, coal industry) |
|  | Close proximity to roadways threatened with de-icing salts Distance to roadways < 10 m |

| Outdoor applications | |
|--|---|
|   | Special applications Areas with special corrosive conditions, e.g. road tunnels with de-icing salt, indoor swimming pools, special applications in the chemical industry (exceptions possible). |

Important notes

The ultimate decision on the required corrosion protection must be made by the customer. Hilti accepts no responsibility regarding the suitability of a product for a specific application, even if informed of the application conditions.

The tables are based on an average service life for typical applications.

For metallic coatings, e.g. zinc layer systems, the end of lifetime is the point at which red rust is visible over a large fraction of the product and widespread structural deterioration can occur – the initial onset of rust may occur sooner.

National or international codes, standards or regulations, customer and/or industry specific guidelines must be independently considered and evaluated.

These guidelines apply to atmospheric corrosion only. Special types of corrosion, such as crevice corrosion or hydrogen assisted cracking must be independently evaluated.

The tables published in this brochure describe only a general guideline for commonly accepted applications in typical atmospheric environments.

Suitability for a specific application can be significantly affected by localised conditions, including but not limited to:

Elevated temperatures and humidity; High levels of airborne pollutants; Direct contact with corrosive products, such as found in some types of chemically-treated wood, waste water, concrete additives, cleaning agents, etc. ;Direct contact to soil, stagnant water; Electrical current; Contact with dissimilar metals; Confined areas, e.g. crevices; Physical damage or wear; Extreme corrosion due to combined effects of different influencing factors; Enrichment of pollutants on the product

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for non-cracked and cracked concrete C 20/25 to C 50/60
- High loading capacity
- Suitable for dry and water saturated concrete
- Hilti Technical Data for under water application
- Hilti Technical Data for service life of 100 years
- High corrosion resistance
- Long working time at elevated temperatures
- Cures down to -5 °C
- Odourless epoxy

Static and quasi-static resistance (for a single anchor)

All data in this section applies to:

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- **Steel** failure
- HAS-U anchor rod with strength class 5.8 and 8.8, AM anchor rod with strength class 8.8, HIS-N internally threaded insert with screw 8.8
- Base material thickness and one typical embedment depth, as specified in the table
- Concrete C 20/25
- Service life: 100 years
- Temperature range I: -40 °C to +40 °C
(min. base material temperature -40 °C, max. long/short term base material temperature: +24 °C/40 °C)
- Short term loading. For long term loading apply ψ_{sus} acc. to EN 1992-4

Seismic resistance (for a single anchor)

All data in this section applies to:

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- **Steel** failure
- HAS-U anchor rod with strength class 8.8, AM anchor rod with strength class 8.8, HIS-N internally threaded insert with screw 8.8
- Base material thickness and one typical embedment depth, as specified in the table
- Concrete C 20/25
- Temperature range I
(min. base material temperature -40 °C, max. long/short term base material temperature: +24 °C/40 °C)
- $\alpha_{\text{gap}}=1,0$ (using Hilti seismic filling set)

Setting information

Installation temperature

-5 °C to +40 °C

Service temperature range

Hilti HIT-RE 500 V4 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +55 °C | +43 °C | +55 °C |
| Temperature range III | -40 °C to +75 °C | +55 °C | +75 °C |

Max. short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material $T^{2)}$ | Working time t_{work} | Minimum curing time $t_{cure}^{1)}$ |
|--|----------------------------|--|
| -5 °C to -1 °C | 2 h | 168 h |
| 0 °C to 4 °C | 2 h | 48 h |
| 5 °C to 9 °C | 2 h | 24 h |
| 10 °C to 14 °C | 1,5 h | 16 h |
| 15 °C to 19 °C | 1 h | 12 h |
| 20 °C to 24 °C | 30 min | 7 h |
| 25 °C to 29 °C | 20 min | 6 h |
| 30 °C to 34 °C | 15 min | 5 h |
| 35 °C to 39 °C | 12 min | 4,5 h |
| 40 °C | 10 min | 4 h |

¹⁾ The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

²⁾ The minimum temperature of the foil pack is +5° C.

Safety regulations

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500 V4.

Drilling

Hammer drilled hole

For dry and wet concrete and installation in flooded holes (no sea water).

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required.
For dry and wet concrete, only.

Diamond Coring

For dry and wet concrete, only.

Diamond Coring + Roughening Tool

For dry and wet concrete only.
Before roughening, the borehole needs to be dry.

Cleaning (Inadequate hole cleaning=poor load values.)

Hammer Drilling:

Compressed air cleaning (CAC)

For all drill hole diameters d_0 and all drill hole depths h_0 .

Hammer drilling:

Cleaning for under water:

For all bore hole diameters d_0 and all bore hole depth h_0 .

Concrete

Hammer drilled flooded holes and diamond cored holes:

For all drill hole diameters d_0 and drill hole depths h_0 .

Chemical anchors

Diamond cored holes with Hilti roughening tool:

For all drill hole diameters d_0 and drill hole depths h_0 .

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for non-cracked and cracked concrete C 20/25 to C 50/60
- ETA approval for seismic performance category C1
- Hilti Technical Data for service life of 100 years
- High loading capacity
- Suitable for dry and water saturated concrete
- Hilti Technical Data for under water application
- Long working time to allow installation of big diameters and/or deep embedment depths even at higher temperature
- Cures down to -5 °C

Static and quasi-static loading (for a single anchor)

All data in this section applies to

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- Steel failure
- Rebar B500
- Base material thickness and one typical embedment depth, as specified in the table
- Concrete C 20/25
- Service life: 50 years
- Temperature range I: -40 °C to +40 °C
(min. base material temperature -40°C, max. long/short term base material temperature: +24°C/40°C)
- Short term loading. For long term loading apply ψ_{SUS} acc. to EN 1992-4
Hammer drilled holes, hammer drilled holes with hollow drill bit and diamond cored holes with Hilti roughening tool: $\psi^0_{\text{SUS}} = 0,88$; diamond cored holes: $\psi^0_{\text{SUS}} = 0,89$

Setting information

Installation temperature range:

-5 °C to +40 °C

Service temperature range

Hilti HIT-RE 500 V4 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +55 °C | +43 °C | +55 °C |
| Temperature range III | -40 °C to +75 °C | +55 °C | +75 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material $T^2)$ | Max. working time in which rebar can be inserted and adjusted t_{gel} | Min. curing time before rebar can be fully loaded $t_{cure}^1)$ |
|---|---|---|
| $-5\text{ °C} \leq T_{BM} < -1\text{ °C}$ | 2 h | 168 h |
| $0\text{ °C} \leq T_{BM} < 4\text{ °C}$ | 2 h | 48 h |
| $5\text{ °C} \leq T_{BM} < 9\text{ °C}$ | 2 h | 24 h |
| $10\text{ °C} \leq T_{BM} < 14\text{ °C}$ | 1,5 h | 16 h |
| $15\text{ °C} \leq T_{BM} < 19\text{ °C}$ | 1 h | 12 h |
| $20\text{ °C} \leq T_{BM} < 24\text{ °C}$ | 30 min | 7 h |
| $25\text{ °C} \leq T_{BM} < 29\text{ °C}$ | 20 min | 6 h |
| $30\text{ °C} \leq T_{BM} < 34\text{ °C}$ | 15 min | 5 h |
| $35\text{ °C} \leq T_{BM} < 39\text{ °C}$ | 12 min | 4,5 h |
| $T_{BM} = 40\text{ °C}$ | 10 min | 4 h |

¹⁾ The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

²⁾ The minimum temperature of the foil pack is +5° C.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500 V4.

Drilling

Hammer drilled hole

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required

Diamond Coring

Diamond Coring + Roughening Tool

For dry and wet concrete only.
Before roughening, the borehole needs to be dry.

Cleaning (Inadequate hole cleaning=poor load values.)

Hammer Drilling:

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Hammer drilling:

Cleaning for under water:

For all bore hole diameters d_0 and all bore hole depth h_0 .

Hammer drilled flooded holes and diamond cored holes:

For all drill hole diameters d_0 and drill hole depths h_0 .

Diamond cored holes with Hilti roughening tool:

For all drill hole diameters d_0 and drill hole depths h_0 .

Injection preparation

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for drill hole depth $h_{ef} > 250$ mm.

Benefits

- SafeSet technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Allows the design of post-installed, moment-resisting reinforced concrete connections under static loading conditions without using a splice configuration according to TR 069
- Suitable for concrete C 12/15 to C 50/60
- ETA Data for 100y service life
- High loading capacity
- Suitable for dry and water saturated concrete
- Non-corrosive to rebar elements
- Long working time at elevated temperatures
- Cures down to -5 °C
- Odourless epoxy

Static design acc. to EOTA TR 069

Concrete

Chemical anchors

Influence of concrete cover/ rebar diameter on the design bond strength values for post-installed rebar acc. to TR 069 and EN 1992-1-1.

Mechanical anchors

Plastic/Light duty metal anchors

Influence of anchorage length/ rebar diameter on the design bond strength values for post-installed rebar acc. to TR 069 and EN 1992-1-1.

Insulation anchors

Characteristic bond-splitting resistance according to EOTA TR 069 (for $7\phi \leq l_b \leq 20\phi$) for a working life of 50 and 100 years:

$$\tau_{Rk,sp} = A_k \cdot \left(\frac{f_{ck}}{25}\right)^{sp1} \cdot \left(\frac{25}{\phi}\right)^{sp2} \cdot \left[\left(\frac{c_d}{\phi}\right)^{sp3} \cdot \left(\frac{c_{max}}{c_d}\right)^{sp4} + k_m \cdot K_{tr}\right] \cdot \left(\frac{7\phi}{l_b}\right)^{lb1} \cdot \Omega_{p,tr} \leq \tau_{Rk,ucr} \cdot \Omega_{cr} \cdot \Omega_{p,tr} \cdot \psi_{sus}$$

- $\tau_{Rk,sp}$ = characteristic bond-splitting resistance in [N/mm²] (service life 50 or 100 years).
- f_{ck} = characteristic cylinder concrete compressive strength in [N/mm²].
- ϕ = rebar diameter in [mm].
- c_d = min. clear concrete cover in [mm].
- c_{max} = max. clear concrete cover in [mm].
- k_m = factor of effectiveness of transverse reinforcement.
- K_{tr} = normalized ratio of transverse reinforcement.
- l_b = effective embedment length of the rebar [mm].
- $\Omega_{p,tr}$ = factor to account for transverse pressure in concrete.
- ψ_{sus} = factor to account for effect of sustained loads on the bond strength acc. to EN 1992-4.
Hammer drilled holes, hammer drilled holes with hollow drill bit and diamond cored holes with Hilti roughening tool: $\psi_{sus}^0 = 0,88$ (recommendation: $\psi_{sus,100}^0 = 0,6$).

$\tau_{Rk,ucr}$ or $\tau_{Rk,100,ucr}$, A_k , $sp1$, $sp2$, $sp3$, $sp4$, $lb1$ and Ω_{cr} given in Table below.

Temperature reduction factor $k_{fi}(\theta)$ for concrete class C20/25 for good bond conditions according to ETA-20/0540 for working life of 50 and 100 years¹⁾

The design value of the bond resistance $f_{bd,fi}$ under fire exposure has to be calculated by the following equation:

$$f_{bd,fi} = k_{b,fi}(\theta) \cdot f_{bd,PIR} \cdot \frac{\gamma_c}{\gamma_{M,fi}} \quad \text{for a working life of 50 years}$$

$$f_{bd,fi,100y} = k_{b,fi,100y}(\theta) \cdot f_{bd,PIR,100y} \cdot \frac{\gamma_c}{\gamma_{M,fi}} \quad \text{for a working life of 100 years}$$

with $\theta \leq 305^\circ\text{C}$: $k_{b,fi}(\theta) = \frac{651,24 \cdot \theta^{-1,115}}{f_{bd,PIR} \cdot 4,3} \leq 1,0$ for a working life of 50 years

$$k_{b,fi,100y}(\theta) = \frac{651,24 \cdot \theta^{-1,115}}{f_{bd,PIR,100y} \cdot 4,3} \leq 1,0 \quad \text{for a working life of 100 years}$$

$$\theta > 305^\circ\text{C}: \quad k_{b,fi}(\theta) = k_{b,fi,100y}(\theta) = 0,0$$

$f_{bd,fi,50y}$ = Design value of the bond resistance in case of fire in N/mm² (service life 50 years).

$f_{bd,fi,100y}$ = Design value of the bond resistance in case of fire in N/mm² (service life 100 years).

(θ) = Temperature in °C in the mortar layer.

$k_{b,fi}(\theta)$ = Reduction factor under fire exposure.

$k_{b,fi,100y}(\theta)$ = Reduction factor under fire exposure for a working life of 100 years.

$f_{bd,PIR}$ = Design value of the bond resistance in N/mm² in cold condition according to Table C3 or C6 of ETA 20/0540 considering the concrete classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1.

$f_{bd,PIR,100y}$ = Design value of the bond strength in N/mm² in cold condition according to Table C3 or Table C6 considering the concrete classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1 for a working life of 100 years.

γ_c = Partial safety factor according to EN 1992-1-1

$\gamma_{M,fi}$ = Partial safety factor according to EN 1992-1-2

For evidence under fire exposure the anchorage length shall be calculated according to EN 1992-1-1:2004+AC:2010 Equation 8.3 using the temperature-dependent bond resistance $f_{bd,fi}$.

Fitness for use

Some creep tests have been conducted in accordance with EAD 330087 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 500 V4: low displacements with long term stability, failure load after exposure above reference load.

Installation temperature range

-5 °C to +40 °C

Service temperature range

Hilti HIT-RE 500 V4 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

ETA-20/0540

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

ETA-20/0539

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +55 °C | +43 °C | +55 °C |
| Temperature range III | -40 °C to +75 °C | +55 °C | +75 °C |

Max. short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as result of diurnal cycling.

Max. long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time¹⁾

| Temperature of the base material $T^2)$ | Working time in which rebar can be inserted and adjusted t_{gel} | Initial curing time $t_{cure,ini}$ | Curing time before rebar can be fully loaded t_{cure} |

| $25\text{ °C} \leq T_{BM} < 29\text{ °C}$ | 20 min | 3,5 h | 6 h |
| $30\text{ °C} \leq T_{BM} < 34\text{ °C}$ | 15 min | 3 h | 5 h |
| $35\text{ °C} \leq T_{BM} < 39\text{ °C}$ | 12 min | 2 h | 4,5 h |
| $T_{BM} = 40\text{ °C}$ | 10 min | 2 h | 4 h |

¹⁾ The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

²⁾ The minimum temperature of the foil pack is +5° C.

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for cracked/non-cracked concrete C 20/25 to C 50/60
- High loading capacity
- Suitable for dry and water saturated concrete
- Hilti Technical Data for under water application
- High corrosion resistance
- Long working time at elevated temperatures
- Cures down to -5°C
- Odourless epoxy

Seismic resistance

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Anchor HAS-U strength class 8.8, anchor AM 8.8
- Base material thickness, as specified in the table
- One typical embedment depth as specified in the table
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperature range I
(min. base material temperature -40°C , max. long/short term base material temperature: $+24^\circ\text{C}/40^\circ\text{C}$)
- $\alpha_{gap}=1,0$ (using Hilti seismic filling set)

Setting information

Installation temperature

-5°C to +40°C

Service temperature range

Hilti HIT-RE 500 V3 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +70 °C | +43 °C | +70 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material T | Working time t _{work} | Minimum curing time t _{cure} ¹⁾ |
|---------------------------------------|-----------------------------------|--|
| -5 °C to -1 °C | 2 h | 168 h |
| 0 °C to 4 °C | 2 h | 48 h |
| 5 °C to 9 °C | 2 h | 24 h |
| 10 °C to 14 °C | 1,5 h | 16 h |
| 15 °C to 19 °C | 1 h | 12 h |
| 20 °C to 24 °C | 30 min | 7 h |
| 25 °C to 29 °C | 20 min | 6 h |
| 30 °C to 34 °C | 15 min | 5 h |
| 35 °C to 39 °C | 12 min | 4,5 h |
| 40 °C | 10 min | 4 h |

1) The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)

b) h : base material thickness ($h \geq h_{min}$)

c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500 V3.

Drilling

Hammer drilled hole

For dry and wet concrete and installation in flooded holes (no sea water).

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required.
For dry and wet concrete, only.

Diamond Coring

For dry and wet concrete, only.

Diamond Coring + Roughening Tool

For dry and wet concrete only.
Before roughening, the borehole needs to be dry.

Cleaning (Inadequate hole cleaning=poor load values.)

Hammer Drilling:

Compressed air cleaning (CAC)

For all drill hole diameters d_0 and all drill hole depths h_0 .

Hammer drilling:

Cleaning for under water:

For all bore hole diameters d_0 and all bore hole depth h_0 .

Hammer drilled flooded holes and diamond cored holes:

Compressed air cleaning (CAC)
 for all drill hole diameters d_0 and drill hole depths h_0 .

Diamond cored holes with Hilti roughening tool:

Compressed air cleaning (CAC)
 for all drill hole diameters d_0 and drill hole depths h_0 .

Injection preparation

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for non-cracked and cracked concrete C 20/25 to C 50/60
- ETA approval for seismic performance category C1
- Hilti Technical Data for seismic performance category C2
- High loading capacity
- Suitable for dry and water saturated concrete
- Hilti Technical Data for under water application
- Fastest curing epoxy mortar to speed up construction process
- Long working time to allow installation of big diameters and/or deep embedment depths even at higher temperature
- Cures down to -5°C

Static and quasi-static loading (for a single anchor)

All data in this section applies to

- Design according to TR029
- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- Rebar B500B
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I (min. base material temp. -40°C , max. long term/short term base material temp.: $+24^\circ\text{C}/40^\circ\text{C}$)
- Short term loading. For long term loading please apply ψ_{sus} .
 - Hammer drilled holes, hammer drilled holes with hollow drill bit and diamond cored holes with Hilti roughening tool: $\psi_{sus} = 0.88$

Setting information

Installation temperature range:

-5°C to +40°C

Service temperature range

Hilti HIT-RE 500 V3 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 70 °C | + 43 °C | + 70 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| $T_{BM} = 40\text{ °C}$ | 10 min | 4 h |

1) The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

1) Additional Hilti Technical data

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) both given values for drill bit diameter can be used
- b) $h_{\text{ef,min}} \leq h_{\text{ef}} \leq h_{\text{ef,max}}$ (h_{ef} : embedment depth)
- c) h : base material thickness ($h \geq h_{\text{min}}$)
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for concrete C 12/15 to C 50/60
- High loading capacity
- Suitable for dry and water saturated concrete
- Non-corrosive to rebar elements
- Long working time at elevated temperatures
- Cures down to -5°C
- Odourless epoxy
- Fire time exposure up to 4h

Fire resistance

Temperature reduction factor $k_{fi}(\theta)$

The design value of the bond resistance $f_{bd,fi}$ under fire exposure has to be calculated by the following equation:

$$f_{bd,fi} = k_{b,fi}(\theta) \cdot f_{bd} \cdot \frac{\gamma_c}{\gamma_{M,fi}}$$

If $\theta > 42^\circ\text{C}$:

$$k_{b,fi}(\theta) = \frac{651.24 \cdot \theta^{-1.115}}{f_{bd} \cdot 4.3} \leq 1,0$$

If $\theta > 305^\circ\text{C}$:

$$k_{b,fi}(\theta) = 0.0$$

$f_{bd,fi}$ = Design value of the bond resistance in case of fire in N/mm²

(θ) = Temperature in °C in the mortar layer.

$k_{b,fi}(\theta)$ = Reduction factor under fire exposure.

$f_{bd,fi}(\theta)$ = Design value of the bond resistance in N/mm² in cold condition according to Table C2 or C3 considering the concrete classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1.

γ_c = Partial safety factor according to EN 1992-1-1

$\gamma_{M,fi}$ = Partial safety factor according to EN 1992-1-2

For evidence under fire exposure the anchorage length shall be calculated according to EN 1992-1-1:2004+AC:2010 Equation 8.3 using the temperature-dependent bond resistance $f_{bd,fi}$.

b) Overlap joint application

Max. bond stress, $f_{bd, FIRE}$, depending on actual clear concrete cover for classifying the fire resistance.

It must be verified that the actual force in the bar during a fire, $F_{s, T}$, can be taken up by the bar connection of the selected length, l_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s, T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd, FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

$f_{bd, FIRE}$ = bond stress when exposed to fire

Critical temperature-dependent bond stress, $f_{bd, FIRE}$, concerning “overlap joint” for Hilti HIT-RE 500 V3 injection adhesive in relation to fire resistance class and required minimum concrete coverage c.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 500 V3: low displacements with long term stability, failure load after exposure above reference load.

Electrical Conductivity

HIT-RE 500 V3 in the hardened state **is not conductive electrically**. Its electric resistivity is $66 \cdot 10^{12} \Omega \cdot m$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway).

Installation temperature range

-5°C to +40°C

Service temperature range

Hilti HIT-RE 500 V3 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500 V3.

Hammer drilled hole (HD)

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required

Diamond Drilling (DD)

Diamond Drilling + Roughening Tool (DD+RT)

Hammer Drilling:

Manual cleaning (MC)

for drill diameters $d_0 \leq 20$ mm and drill hole depth $h_0 \leq 10 \cdot d$.

Hammer Drilling:

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Diamond cored holes:

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths h_0 .

Diamond cored holes with Hilti roughening tool:

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths h_0 .

Injection system preparation.

Injection method for drill hole depth

$h_{ef} \leq 250$ mm.

Injection method for drill hole depth

$h_{ef} > 250$ mm.

Injection method for overhead application.

Setting element, observe working time "t_{work}".

Setting element for overhead applications, observe working time "t_{work}".

Apply full load only after curing time "t_{cure}".

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for non-cracked and cracked concrete C 20/25 to C 50/60
- ETA Approved for seismic performance category C1, C2^{a)}
- Maximum load performance in cracked concrete and non-cracked concrete
- 100 years service lifetime resistance^{b)}
- Small edge distance and anchor spacing possible
- Manual cleaning for borehole diameter up to 20mm and $h_{ef} \leq 10d$ for non-cracked concrete only
- Three mortar versions: HY-200-R and HY-200-R V3 for slow cure applications and HY 200-A for fast cure applications

a) HIS-N internally threaded sleeves not approved for Seismic.
b) Only HIT-Z anchor rod has this feature.

Static and quasi-static resistance (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25
- Temperature range I (min. base material temp. -40°C, max. long/short term base material temp.: +24°C/40°C)
- Short term loading. For long term loading please apply $\psi_{\text{sus}} = 0.74^{\text{b)}$

b) HIT-Z and HAS-D are suitable for permanent loading without any load reduction. ψ_{sus} is not considered for this element.

For hammer drilled holes, hammer drilled holes with Hilti hollow drill bit:

Seismic resistance (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction with hammer drilling)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25
- Temperature range I (min. base material temp. -40°C, max. long/short term base material temp.: +24°C/40°C)
- Installation temperature range -10°C to +40°C
- $\alpha_{gap} = 1,0$ (using Hilti seismic filling set)

For hammer drilled holes and hammer drilled holes with Hilti hollow drill bit:

Setting information

In service temperature range

Hilti HIT-HY 200 A (R) injection mortar with anchor rod HAS-U / HIS-(R)N may be applied in the temperature ranges given below. An elevated base material temperature leads to a reduction of the design bond resistance.

Temperature in the base material

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|-----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |
| Temperature range III | -40 °C to +120 °C | +72 °C | +120 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth).

b) Maximum recommended torque moment to avoid splitting failure during instalation with minimum spacing and edge distance.

c) h : base material thickness ($h \geq h_{min}$).

Minimum edge distance and spacing – Explanation

Minimum edge and spacing geometrical requirements are determined by testing the installation conditions in which two anchors with a given spacing can be set close to an edge without forming a crack in the concrete due to tightening torque.

The HIT-Z boundary conditions for edge and spacing geometry can be found in the tables to the left. If the embedment depth and slab thickness are equal to or greater than the values in the table, then the edge and spacing values may be utilized.

PROFIS Anchor software is programmed to calculate the referenced equations in order to determine the optimized related minimum edge and spacing based on the following variables:

| | |
|---|--|
| Cracked or non-cracked concrete | For cracked concrete it is assumed that a reinforcement is present which limits the crack width to 0,3 mm, allowing smaller values for minimum edge distance and minimum spacing |
| Anchor diameter | For smaller anchor diameter a smaller installation torque is required, allowing smaller values for minimum edge distance and minimum spacing |
| Slab thickness and embedment depth | Increasing these values allows smaller values for minimum edge distance and minimum spacing |

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- ETA seismic approval C1
- Suitable for cracked and non-cracked concrete C 20/25 to C 50/60
- Suitable for dry and water saturated concrete
- High loading capacity, excellent handling
- Small edge distance and anchor spacing possible
- In service temperature range up to 120°C short term / 72°C long term
- Large diameter applications
- Two mortar versions: HY 200-R for slow cure applications and HY 200-A for fast cure applications

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance,

| Temperature range | Base material temperature | Max, long term base material temperature | Max, short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |
| Temperature range III | -40 °C to + 120 °C | + 72 °C | + 120 °C |

Max, short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g, as a result of diurnal cycling,

Max, long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time,

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- HY 200-R version is formulated for best handling and cure time specifically for rebar applications
- Approved for ETA seismic C1 approval for post-installed-rebar
- Suitable for concrete C 12/15 to C 50/60
- Suitable for dry and water saturated concrete
- For rebar diameters up to 32 mm
- Non corrosive to rebar elements
- Good load capacity at elevated temperatures
- Suitable for embedment length up to 1000 mm
- Suitable for applications down to -10 °C
- Two mortar versions: HY 200-A for slow cure applications and HY 200-R for fast cure applications

b) Overlap joint application

Max. bond stress, $f_{bd, FIRE}$, depending on actual clear concrete cover for classifying the fire resistance.

It must be verified that the actual force in the bar during a fire, $F_{s, T}$, can be taken up by the bar connection of the selected length, l_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s, T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd, FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

$f_{bd, FIRE}$ = bond stress when exposed to fire

Critical temperature-dependent bond stress, τ_c , concerning “overlap joint” for Hilti HIT-HY 200 injection adhesive in relation to fire resistance class and required minimum concrete coverage c.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 200: low displacements with long term stability, failure load after exposure above reference load.

Electrical Conductivity

HIT-HY 200 in the hardened state **is not conductive electrically**. Its electric resistivity is $15,5 \cdot 10^9 \Omega \cdot \text{cm}$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchoring (ex: railway applications, subway).

Setting information
Installation temperature range

-10°C to +40°C

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-HY 200.

Hammer drilled hole (HD)

Hammer drilled hole with Hollow Drilled Bit (HDB)
No cleaning required

Diamond Drilling + Roughening Tool (DD+RT)

Hammer drilling:
Manual cleaning (MC)
for drill diameters $d_0 \leq 20$ mm and drill hole depth $h_0 \leq 10 \cdot d$.

Hammer drilling:
Compressed air cleaning (CAC)
for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Diamond cored holes with Hilti roughening tool:
For all drill hole diameters d_0 and drill hole depths h_0 .

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for drill hole depth $h_{ef} > 250\text{mm}$.

Injection method for overhead application.

Setting element, observe working time " t_{work} ".

Setting element for overhead applications, observe working time " t_{work} ".

Apply full load only after curing time " t_{cure} ".

Hilti HIT-HY 200-R V3

500 ml foil pack
(also available as 330 ml foil pack)

Anchor rod:
HAS-U
HAS-U HDG
HAS-U A4
HAS-U HCR
(M8-M30)

Internally threaded sleeve:
HIS-N
HIS-RN
(M8-M20)

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Suitable for uncracked and cracked concrete C 20/25 to C 50/60
- ETA Approved for seismic performance category C1, C2^{a)}
- Maximum load performance in cracked concrete and uncracked concrete
- High corrosion / corrosion resistance^{b)}
- Small edge distance and anchor spacing possible
- Manual cleaning for borehole diameter up to 20mm and $h_{ef} \leq 10d$ for uncracked concrete only

a) HIS-N internally threaded sleeves not approved for Seismic.
 b) High Corrosion resistant rods available only for HAS-U. Corrosion resistant rods available for HAS-U and HIS-N.

Static and quasi-static resistance (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperature range I (min. base material temp. -40°C , max. long/short term base material temp.: $+24^\circ\text{C}/40^\circ\text{C}$)
- Short term loading. For long term loading please apply $\psi_{sus} = 0.74$.

For hammer drilled holes, hammer drilled holes with Hilti hollow drill bit:

Seismic resistance (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction with hammer drilling)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperature range I (min. base material temp. -40°C , max. long/short term base material temp.: $+24^\circ\text{C}/40^\circ\text{C}$)
- Installation temperature range -10°C to $+40^\circ\text{C}$
- $\alpha_{gap} = 1,0$ (using Hilti seismic filling set)

Setting information

In service temperature range

Hilti HIT-HY 200-R V3 injection mortar with anchor rod HAS-U / HIS-(R)N may be applied in the temperature ranges given below. An elevated base material temperature leads to a reduction of the design bond resistance.

Temperature in the base material

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|-----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |
| Temperature range III | -40 °C to +120 °C | +72 °C | +120 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Curing and working time

| Temperature of the base material | HIT-HY 200-R V3 | |

| Critical edge distance for concrete cone failure ^{d)} | $C_{cr,N}$ [mm] | $1,5 h_{ef}$ | | | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and edge distance
- c) h : base material thickness ($h \geq h_{min}$)
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the same side.

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- Assessed following the EAD 332402-00-0601 "Post-Installed Reinforcing Bar (Rebar) Connections with Improved Bond-Splitting Behavior Under Static Loading".
- Allows the design of post-installed, moment-resisting reinforced concrete connections under static loading conditions without using a splice configuration according to TR 069
- ETA seismic approval C1
- Suitable for cracked and uncracked concrete C 12/15 to C 50/60
- Suitable for dry and water saturated concrete
- In service temperature range up to 120°C short term / 72°C long term
- Large diameter applications

Static and quasi-static loading (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperature range I
(min. base material temperature -40°C , max. long term/short term base material temperature: $+24^\circ\text{C}/40^\circ\text{C}$)

Setting information

Installation temperature range

- 10°C to + 40°C

Service temperature range

Hilti HIT-HY 200-R V3 injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max, long term base material temperature | Max, short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |
| Temperature range III | -40 °C to + 120 °C | + 72 °C | + 120 °C |

Max, short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g, as a result of diurnal cycling.

Max, long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced,

- a) Both given values for drill bit diameter can be used
- b) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- c) h : base material thickness ($h \geq h_{min}$)
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

($\phi 8$ - $\phi 32$)

Benefits

- **SafeSet** technology: Simplified method of borehole preparation using either Hilti hollow drill bit for hammer drilling or Roughening tool for diamond cored applications
- HY 200-R version is formulated for best handling and cure time specifically for rebar applications
- Approved for ETA seismic C1 approval for post-installed-rebar
- Suitable for concrete C 12/15 to C 50/60
- Suitable for dry and water saturated concrete
- For rebar diameters up to 32 mm
- Non corrosive to rebar elements
- Good load capacity at elevated temperatures
- Suitable for embedment length up to 1000 mm
- Suitable for applications down to -10 °C

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 200: low displacements with long term stability, failure load after exposure above reference load.

Electrical Conductivity

HIT-HY 200 in the hardened state **is not conductive electrically**. Its electric resistivity is $15,5 \cdot 10^9 \Omega \cdot \text{cm}$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchoring (ex: railway applications, subway)

Setting information

Installation temperature range

-10°C to +40°C

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Service temperature range

Hilti HIT-RE 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 58 °C | + 35 °C | + 58 °C |
| Temperature range III | -40 °C to + 70 °C | + 43 °C | + 70 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Max. working time in which rebar can be inserted and adjusted t_{work} | Min. curing time before rebar can be fully loaded t_{cure} |
|---|--|--|
| $5\text{ °C} \leq T_{BM} < 10\text{ °C}$ | 2 h | 72 h |
| $10\text{ °C} \leq T_{BM} < 15\text{ °C}$ | 1,5 h | 48 h |
| $15\text{ °C} \leq T_{BM} < 20\text{ °C}$ | 30 min | 24 h |
| $20\text{ °C} \leq T_{BM} < 30\text{ °C}$ | 20 min | 12 h |
| $30\text{ °C} \leq T_{BM} < 40\text{ °C}$ | 12 min | 8 h |
| 40 °C | 12 min | 4 h |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

| Torque moment ^{c)} T_{max} [Nm] | 10 | 20 | 40 | 80 | 150 | 200 | 270 | 300 |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth) h : base material thickness ($h \geq h_{min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 100.

Drilling

Hammer drilled hole

For dry and wet concrete.

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required.

Cleaning

Manual cleaning (MC) Non-cracked concrete only

for drill diameters $d_0 \leq 20$ mm and drill hole depth $h_0 \leq 10 \cdot d$.

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Compressed air cleaning (CAC) cleaning of flooded holes

for all drill hole diameters d_0 and drill hole depths h_0 .

Injection system

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for overhead application and/or installation with embedment depth $h_{ef} > 250$ mm.

Fire resistance

The design value of the bond strength $f_{bd,fi}$ under fire exposure has to be calculated by the following equation:

$$f_{bd,fi} = k_{b,fi}(\theta) \cdot f_{bd} \cdot \gamma_c / \gamma_{M,fi}$$

With: $\theta \leq 123,2^\circ\text{C}$: $k_{b,fi}(\theta) = 26,424 \cdot e^{-0,0215 \cdot \theta} / f_{bd} \cdot 4,3 \leq 1,0$
 $\theta > 123,2^\circ\text{C}$: $k_{b,fi}(\theta) = 0,0$

$f_{bd,fi}$ design value of the ultimate bond stress in case of fire in N/mm^2
 θ temperature in $^\circ\text{C}$ in the mortar layer
 $k_{b,fi}(\theta)$ reduction factor under fire exposure
 f_{bd} design values of the ultimate bond stress in N/mm^2 in cold condition

 $\gamma_{M,fi}$ partially safety factor according to EN 1992-1-2

b) Overlap joint application

Max, bond stress, $f_{bd,FIRE}$, depending on actual clear concrete cover for classifying the fire resistance,

It must be verified that the actual force in the bar during a fire, $F_{s,T}$, can be taken up by the bar connection of the selected length, l_{inst} , Note: Cold design for ULS is mandatory,

$$F_{s,T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd,FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days,**

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 100: low displacements with long term stability, failure load after exposure above reference load,

Electrical Conductivity

HIT-RE 100 in the hardened state is **not conductive electrically**, Its electric resistivity is $1,4 \cdot 10^{10} \Omega \cdot m$ (DIN IEC 93 – 12,93), It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway),

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-RE 100 injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance,

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g, as a result of diurnal cycling,

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time,

Working time and curing time^{a)}

| Temperature IN the base material T_{BM} | Maximum working time t_{work} | Initial curing time $t_{cure,ini}^{b)}$ | Minimum curing time t_{cure} |
|--|---------------------------------|---|--------------------------------|
| $5\text{ °C} \leq T_{BM} < 9\text{ °C}$ | 2 hours | 18 hours | 72 hours |
| $10\text{ °C} \leq T_{BM} < 14\text{ °C}$ | 1,5 hours | 12 hours | 48 hours |
| $15\text{ °C} \leq T_{BM} < 19\text{ °C}$ | 30 min | 8 hours | 24 hours |
| $20\text{ °C} \leq T_{BM} < 24\text{ °C}$ | 25 min | 6 hours | 12 hours |
| $25\text{ °C} \leq T_{BM} < 29\text{ °C}$ | 20 min | 5 hours | 10 hours |
| $30\text{ °C} \leq T_{BM} \leq 39\text{ °C}$ | 12 min | 4 hours | 8 hours |
| 40 °C | 12 min | 2 hours | 4 hours |

a) The curing time data are valid for dry base material only, In wet base material the curing times must be doubled,

b) After $t_{cure,ini}$ has elapsed preparation work may continue

HIT-RE 100-HC injection mortar

Anchor design (EN 1992-4) / Rods&Sleeves / Concrete

Injection mortar system

Hilti HIT-RE 100-HC
580 ml hard cartridge

Anchor rods:
HAS-U
HAS-U HDG
HAS-U A4
HAS-U HCR
(M8-M30)

Benefits

- Suitable for cracked and uncracked concrete C 20/25 to C 50/60
- High loading capacity
- Suitable for dry and water saturated concrete
- Large diameter applications
- Long working time at elevated temperatures
- Odourless epoxy

Static and quasi-static loading (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Anchor HAS-U with strength 5.8
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C , max. long term/short term base material temperature: $+24^\circ\text{C}/40^\circ\text{C}$)

Setting information

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-RE 100-HC injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 58 °C | + 35 °C | + 58 °C |
| Temperature range III | -40 °C to + 70 °C | + 43 °C | + 70 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Max. working time in which rebar can be inserted and adjusted t_{work} | Min. curing time before rebar can be fully loaded t_{cure} |
|--|--|--|
| $5\text{ °C} \leq T_{BM} < 10\text{ °C}$ | 2,5 h | 72 h |
| $10\text{ °C} \leq T_{BM} < 15\text{ °C}$ | 2 h | 48 h |
| $15\text{ °C} \leq T_{BM} < 20\text{ °C}$ | 1 h | 24 h |
| $20\text{ °C} \leq T_{BM} < 30\text{ °C}$ | 40 min | 18 h |
| $30\text{ °C} \leq T_{BM} \leq 40\text{ °C}$ | 20 min | 6 h |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

| Torque moment ^{c)} T_{max} [Nm] | 10 | 20 | 40 | 80 | 150 | 200 | 270 | 300 |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth) h : base material thickness ($h \geq h_{min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

No cleaning required.

Cleaning

Manual cleaning (MC) Non-cracked concrete only

for drill diameters $d_0 \leq 20$ mm and drill hole depths $h_0 \leq 10 \cdot d$.

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Compressed air cleaning (CAC) cleaning of water-filled holes

for all drill hole diameters d_0 and drill hole depths h_0 .

Injection system

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for overhead application and/or installation with embedment depth $h_{ef} > 250$ mm.

Setting the element

Setting element, observe working time " t_{work} ",

Setting element for overhead applications, observe working time " t_{work} ",

Loading the anchor: After required curing time t_{cure} the anchor can be loaded.

Setting information

Installation temperature

+ 5°C to + 40°C

Service temperature range

Hilti HIT-RE 100-HC injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance,

| Temperature range | Base material temperature | Max, long term base material temperature | Max, short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 58 °C | + 35 °C | + 58 °C |
| Temperature range III | -40 °C to + 70 °C | + 43 °C | + 70 °C |

Max, short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g, as a result of diurnal cycling,

Max, long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time,

Working time and curing time

| Temperature of the base material | Max, working time in which rebar can be inserted and adjusted t_{work} | Min, curing time before rebar can be fully loaded t_{cure} |
|--|--|--|
| $5\text{ °C} \leq T_{BM} < 10\text{ °C}$ | 2,5 h | 72 h |
| $10\text{ °C} \leq T_{BM} < 15\text{ °C}$ | 2 h | 48 h |
| $15\text{ °C} \leq T_{BM} < 20\text{ °C}$ | 1 h | 24 h |
| $20\text{ °C} \leq T_{BM} < 30\text{ °C}$ | 40 min | 18 h |
| $30\text{ °C} \leq T_{BM} \leq 40\text{ °C}$ | 20 min | 6 h |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled,

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced,

a) Both given values for drill bit diameter can be used

b) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)

c) h : base material thickness ($h \geq h_{min}$)

d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance, The simplified formula given in this table is on the save side,

Fire resistance

The design method consists of four steps. First, determining a reduction factor $KN(\theta)$, which describes the proportion between bond resistance and temperature, based on pullout tests at various temperatures. Secondly, a thermal simulation using the Finite Elements method is carried out to determine the temperature figure along the rebar at certain time T during a fire. Thirdly, the bond resistances in case of fire are estimated using the first two steps. A fourth step, in case of the beam-wall connection, is the calculation of the characteristic maximal load by integration of the bond resistance. Thermal simulations, geometrics considerations and safety co-efficients are determined in accordance with Eurocode and standards.

Step 1

Reduction factor $KN(\theta)$

Step 2

Finite Element simulation: Temperature profile for each rebar diameter and anchorage length along the bonding interface in relation to the fire exposure duration T .

Step 3

Slab-slab connection: TR_k along the bonding interface

Step 4

Characteristic maximal load

$$F_{bk} = \emptyset \cdot \pi \cdot \int_0^L \tau_{Rk} \cdot (T(x)) \cdot dx$$

Where:

- τ_{Rk} : the characteristic bonding resistance [N/mm²].
- T : the temperature [°].
- F_{bk} : the characteristic maximum load applicable to the rebar at a given time [N].
- L : the embedment length [mm].
- \emptyset : the rebar diameter [mm].

Relationship between temperature and the reduction factor

$$\begin{aligned}
 20^{\circ}\text{C} \leq \theta \leq 49^{\circ}\text{C} & \quad k_N = 1 \\
 50^{\circ}\text{C} \leq \theta \leq 311^{\circ}\text{C} & \quad k_N = \frac{1285,7 * \theta^{-1,249}}{10} \\
 \theta > 311^{\circ}\text{C} & \quad k_N = 0
 \end{aligned}$$

This report uses the characteristic values of bond strength. Accordingly, the values of bond resistance and load resistance in case of fire are given as characteristic values

b) Overlap joint application

Max, bond stress, $f_{bd,FIRE}$, depending on actual clear concrete cover for classifying the fire resistance,

It must be verified that the actual force in the bar during a fire, $F_{s,T}$, can be taken up by the bar connection of the selected length, l_{inst} , Note: Cold design for ULS is mandatory,

$$F_{s,T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd,FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

$f_{bd,FIRE}$ = bond stress when exposed to fire

Critical temperature-dependent bond resistance, $f_{bk,FIRE}$, concerning “overlap joint” for Hilti HIT-RE 100-HC injection adhesive in relation to fire resistance class and required minimum concrete coverage c.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days**,

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 100-HC: low displacements with long term stability, failure load after exposure above reference load,

Electrical Conductivity

HIT-RE 100-HC in the hardened state **is not conductive electrically**, Its electric resistivity is $1,4 \cdot 10^{10} \Omega \cdot m$ (DIN IEC 93 – 12,93), It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway),

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-RE 100-HC injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance,

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g, as a result of diurnal cycling,

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time,

Working time and curing time^{a)}

| Temperature IN the base material T_{BM} | Maximum working time t_{work} | Initial curing time $t_{cure,ini}^{b)}$ | Minimum curing time t_{cure} |
|--|------------------------------------|--|-----------------------------------|
| $5\text{ °C} \leq T_{BM} < 9\text{ °C}$ | 2,5 h | 18 hours | 72 hours |
| $10\text{ °C} \leq T_{BM} < 14\text{ °C}$ | 2 h | 12 hours | 48 hours |
| $15\text{ °C} \leq T_{BM} < 19\text{ °C}$ | 1 h | 8 hours | 24 hours |
| $20\text{ °C} \leq T_{BM} < 29\text{ °C}$ | 40 min | 6 hours | 18 hours |
| $30\text{ °C} \leq T_{BM} \leq 40\text{ °C}$ | 20 min | 2 hours | 6 hours |

- a) The curing time data are valid for dry base material only. In wet base material the curing times must be doubled,
b) After $t_{cure,ini}$ has elapsed preparation work may continue

Benefits

- Suitable non-cracked concrete C 20/25 to C 50/60
- High corrosion^{a)} / corrosion resistant
- Suitable for dry and water saturated concrete
- Small edge distance and anchor spacing possible
- Large diameter applications
- In service temperature range up to 120°C short term / 72°C long term

a) Applications only for HIT-V rods

Setting information

Installation temperature range:

-5°C to +40°C

In service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |
| Temperature range II | -40 °C to + 120 °C | + 72 °C | + 120 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature in the anchorage base | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|---------------------------------|--------------------------------|
| $-5^{\circ}\text{C} < T_{BM} \leq 0^{\circ}\text{C}$ | 90 min | 9 h |
| $0^{\circ}\text{C} < T_{BM} \leq 5^{\circ}\text{C}$ | 45 min | 4,5 h |
| $5^{\circ}\text{C} < T_{BM} \leq 10^{\circ}\text{C}$ | 25 min | 2 h |
| $10^{\circ}\text{C} < T_{BM} \leq 20^{\circ}\text{C}$ | 6 min | 90 min |
| $20^{\circ}\text{C} < T_{BM} \leq 30^{\circ}\text{C}$ | 4 min | 50 min |
| $30^{\circ}\text{C} < T_{BM} \leq 40^{\circ}\text{C}$ | 2 min | 40 min |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

| Critical edge distance for concrete cone failure ^{d)} $C_{cr,N}$ [mm] | $1,5 h_{ef}$ | | | | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing anchor edge distance
- h : base material thickness ($h \geq h_{min}$)
- The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

In service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-----------------------|---------------------------|--|---|
| Temperature range I | - 40 °C to + 40 °C | + 24 °C | + 40 °C |

| Temperature range III | - 40 °C to + 120 °C | + 72 °C | + 120 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

* Values corresponding to the minimum anchorage length. The maximum permissible load is valid for "good bond conditions" as described in EN 1992-1-1. For all other conditions multiply by the value by 0,7. The volume of mortar correspond to the formula " $1,2 \cdot (d_0^2 - d_s^2) \cdot \pi \cdot l_b / 4$ " for hammer drilling

Benefits

- Suitable for cracked^{a)} and non-cracked concrete C 20/25 to C 50/60
- High corrosion^{a)} / corrosion resistant
- Suitable for dry and water saturated concrete
- Small edge distance and anchor spacing possible
- In service temperature range up to 80°C short term / 50°C long term

a) Applications only with HIT-V anchor rods

Setting information

Installation temperature range:

-10°C to +40°C

In service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|---|--|
| -10 °C $< T_{\text{BM}} \leq -5$ °C ^{a)} | 180 min | 12 h |
| -5 °C $< T_{\text{BM}} \leq 0$ °C | 40 min | 4 h |
| 0 °C $< T_{\text{BM}} \leq 5$ °C | 20 min | 2 h |
| 5 °C $< T_{\text{BM}} \leq 20$ °C | 8 min | 1 h |
| 20 °C $< T_{\text{BM}} \leq 30$ °C | 5 min | 30 min |
| 30 °C $< T_{\text{BM}} \leq 40$ °C | 2 min | 30 min |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

a) The foil pack temperature must be between 20°C and 25°C.

Setting information

Installation temperature range:
-10°C to +40°C

In service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|---------------------------------|--------------------------------|
| -10 °C < T_{BM} ≤ -5 °C ^{a)} | 180 min | 12 h |
| -5 °C < T_{BM} ≤ 0 °C | 40 min | 4 h |
| 0 °C < T_{BM} ≤ 5 °C | 20 min | 2 h |
| 5 °C < T_{BM} ≤ 20 °C | 8 min | 1 h |
| 20 °C < T_{BM} ≤ 30 °C | 5 min | 30 min |
| 30 °C < T_{BM} ≤ 40 °C | 2 min | 30 min |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

b) The foil pack temperature must be between 20°C and 25°C.

* Values corresponding to the minimum anchorage length. The maximum permissible load is valid for "good bond conditions" as described in EN 1992-1-1. For all other conditions multiply by the value by 0,7. The volume of mortar correspond to the formula " $1,2 \cdot (d_0^2 - d_s^2) \cdot \pi \cdot l_b / 4$ " for hammer drilling

Fire loading: according to DIBt Z-21.8-2024

a) Fire situation "anchorage"

Maximum force in rebar in conjunction with HIT-HY 100 as a function of embedment depth for the fire resistance classes F30 to F180 (yield strength $f_{yk} = 500 \text{ N/mm}^2$) according to EC2.

b) Fire situation “parallel”

Max. bond stress, τ_c , depending on actual clear concrete cover for classifying the fire resistance.

It must be verified that the actual force in the bar during a fire, $F_{s,T}$, can be taken up by the bar connection of the selected length, l_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s,T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot \tau_c \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

τ_c = bond stress when exposed to fire

Critical temperature-dependent bond stress, τ_c , concerning "overlap joint" for Hilti HIT-HY 100 injection adhesive in relation to fire resistance class and required minimum concrete coverage c.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions : in dry environment at 50 °C during 90 days.

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 100: low displacements with long term stability, failure load after exposure above reference load.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-HY 100.

Drilling

Hammer drilled hole (HD)

Cleaning

Manual cleaning (MC)

for drill diameters $d_0 \leq 18$ mm and drill hole depth $h_0 \leq 10 \cdot d_0$.

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths h_0 .

Injection system

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for application with embedment depth $h_{ef} > 250$ mm.

Concrete

Mechanical anchors

Plastic/Light duty metal anchors

Insulation anchors

Injection method for overhead application and/or installation with embedment depth $h_{ef} > 250$ mm.

Benefits

- Suitable for non-cracked and cracked ^{a)} concrete C 20/25 to C 50/60.
- **SafeSet** technology: Hilti hollow drill bit for hammer drilling
- Suitable for non-cracked concrete C20/25 to C50/60
- Suitable for dry and water saturated concrete
- High loading capacity and fast curing
- Hybrid chemistry
- Good load capacity at elevated temperatures, and suitable for applications down to -5°C

Setting information

Installation temperature:

-5°C to +40°C

Service temperature range:

Hilti HIT-CT 1 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max, long term base material temperature | Max, short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |

Max, short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max, long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Max, working time in which anchor can be inserted and adjusted t_{work} | Min, curing time before anchor can be fully loaded $t_{\text{cure}}^{1)}$ |
|------------------------------------|--|---|
| -5 °C < t_{BM} < 0 °C | 1 hour | 6 hours |
| 0 °C $\leq t_{\text{BM}}$ < 5 °C | 40 min | 3 hours |
| 5 °C $\leq t_{\text{BM}}$ < 10 °C | 25 min | 2 hours |
| 10 °C $\leq t_{\text{BM}}$ < 20 °C | 10 min | 90 min |
| 20 °C $\leq t_{\text{BM}}$ < 30 °C | 4 min | 75 min |
| 30 °C $\leq t_{\text{BM}}$ < 40 °C | 2 min | 60 min |

1) The curing time data are valid for dry base material only. In wet material the curing times must be doubled.

| Critical edge distance for concrete cone failure ^{c)} | $c_{cr,N}$ | $1,5 h_{ef}$ | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- b) Max. recommended torque moment to avoid splitting failure during installation with min. spacing and/or edge distance
- c) h : base material thickness ($h \geq h_{min}$)

According to EN 1992-1-1 $\ell_{b,min}$ (8.6) are calculated for good bond conditions with maximum yield strength $f_{yk}=1,15$ and $\alpha_6 = 1,0$

Temperature reduction factor $k_{fi}(\theta)$

The analytic equation that describe the variation of $k_{fi}(\theta)$ with temperature is given by the following function:

If $39^\circ\text{C} \leq \theta \leq 376^\circ\text{C}$: $k_{fi}(\theta) = 41,001 \times \theta^{-1,012} \leq 1,0$ θ in °C
 If $\theta < 39^\circ\text{C}$: $k_{fi}(\theta) = 1.0$
 If $\theta > 376^\circ\text{C}$: $k_{fi}(\theta) = 0.0$

The design value of ultimate bond strength $f_{bd,fi}$ under fire exposure is calculated according to following equation:

$$f_{bd,fi} = k_{fi}(\theta) \cdot f_{bd} \cdot \gamma_c / \gamma_{M,fi}$$

With:

- $k_{fi}(\theta)$ temperature reduction factor under fire exposure.
- f_{bd} design values of the ultimate bond resistance according to amplification factor α_{1b}
- $\gamma_c = 1,5$ recommended safety factor according to EN 1992-1-1.
- $\gamma_{M,fi}$ safety factor according to EN 1992-1-2 under fire exposure.

Steel failure

b) Overlap joint application

Max. bond stress, $f_{bd, FIRE}$, depending on actual clear concrete cover for classifying the fire resistance. It must be verified that the actual force in the bar during a fire, $F_{s, T}$, can be taken up by the bar connection of the selected length, l_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s, T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd, FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

$f_{bd, FIRE}$ = bond stress when exposed to fire

Critical temperature-dependent bond stress, $f_{bd, FIRE}$, concerning “overlap joint” for Hilti HIT-CT 1 injection adhesive in relation to fire resistance class and required minimum concrete coverage c .

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-CT 1: low displacements with long term stability, failure load after exposure above reference load.

Electrical Conductivity

HIT-CT 1 in the hardened state **is not conductive electrically**. Its electric resistivity is $1,4 \cdot 10^{10} \Omega \cdot m$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchoring (ex: railway applications, subway).

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-CT 1 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|-------------------|---------------------------|---|--|
| Temperature range | -40 °C to +80 °C | +50°C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time ¹⁾

| Temperature of the base material T_{BM} | Working time t_{gel} | Curing time t_{cure} |
|---|------------------------|------------------------|
| $-5\text{ °C} < t_{BM} < 0\text{ °C}$ | 60 min | 6 h |
| $0\text{ °C} \leq t_{BM} < 5\text{ °C}$ | 40 min | 3 h |
| $5\text{ °C} \leq t_{BM} < 10\text{ °C}$ | 25 min | 2 h |
| $10\text{ °C} \leq t_{BM} < 20\text{ °C}$ | 10 min | 90 min |
| $20\text{ °C} \leq t_{BM} < 30\text{ °C}$ | 4 min | 75 min |
| $30\text{ °C} \leq t_{BM} < 40\text{ °C}$ | 2 min | 60 min |

1) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-CT1.

Hammer drilled hole (HD)

Hammer drilled hole with Hollow drill bit (HDB)

No cleaning required

Manual cleaning (MC)

for drill diameters $d_0 \leq 20$ mm and drill hole depth $h_0 \leq 10 \cdot d$ in uncracked concrete.

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 12 \cdot d$.

Injection system preparation.

Injection method for drill hole depth $h_{ef} \leq 250$ mm.

Injection method for drill hole depth $h_{ef} > 250\text{mm}$.

Setting information

Installation temperature range:

-23°C to +32°C

In service temperature range

Hilti HIT-ICE injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature in base material

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 54 °C | + 43 °C | + 54 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Curing time before anchor can be fully loaded t_{cure} | Working time in which anchor can be inserted and adjusted t_{work} |
|----------------------------------|--|--|
| 32 °C | 35 min | 1 min |
| 21 °C | 45 min | 2,5 min |
| 16 °C | 1 h | 5 min |
| 4 °C | 1,5 h | 15 min |
| -7 °C | 6 h | 1 h |
| -18 °C | 24 h | 1,5 h |
| -23 °C | 36 h | 1,5 h |

| Torque moment ^{c)} T_{max} | [Nm] | 10 | 20 | 40 | 80 | 150 | 200 |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- h : base material thickness ($h \geq h_{min}$)
- The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the same side.
- This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and / or edge distance.

| Minimum edge distance | c_{min} [mm] | 40 | 50 | 60 | 70 | 80 | 100 | 125 |
| Critical spacing for splitting failure | $s_{cr,sp}$ [mm] | $2 c_{cr,sp}$ | | | | | | |
| Critical edge distance for splitting failure ^{b)} | $c_{cr,sp}$ [mm] | $1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$ | | | | | | |
| | | $4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$ | | | | | | |
| | | $2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$ | | | | | | |
| Critical spacing for concrete cone failure | $s_{cr,N}$ [mm] | $2 c_{cr,N}$ | | | | | | |
| Critical edge distance for concrete cone failure | $c_{cr,N}$ [mm] | $1,5 h_{ef}$ | | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

a) h : base material thickness ($h \geq h_{min}$)

b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

Setting information

Installation temperature range:

Static and quasi-static loading: -5°C to +40°C

Fatigue cycling loading: 0°C to +40°C

In service temperature range:

Hilti HVZ adhesive anchor with anchor rod HAS-TZ may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | + 50°C | + 80°C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Curing time for mortar capsule HVU-TZ^{a)}

| Temperature of the base material | Release screwed on setting tool curing time t_{rel} | Full load curing time t_{cure} |
|---|---|----------------------------------|
| $-5\text{ °C} \leq T_{BM} < 0\text{ °C}$ | 60 min | 5 hour |
| $0\text{ °C} \leq T_{BM} < 10\text{ °C}$ | 30 min | 1 hour |
| $10\text{ °C} \leq T_{BM} < 20\text{ °C}$ | 20 min | 30 min |
| $20\text{ °C} \leq T_{BM} < 40\text{ °C}$ | 8 min | 20 min |

a) The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

Hole cleaning

Manual cleaning for hammer drilled hole

Setting the element

Check the setting depth.

Insert the foil capsule with the peak ahead to the back of the hole.

Drive the anchor rod with the plugged tool into the hole.

After **required time** remove the screwed on setting tool and excess mortar

Loading the anchor after required curing time t_{cure} and apply installation torque

Use of filling set. Apply installation torque after required curing time, apply the lock nut and fill annular gap between anchor rod and fixture using Hilti injection mortar HY 200-A/R or HY 200-R V3.

- **SafeSet** technology: Hilti hollow drill bit for automatic cleaning
- Suitable for cracked and non-cracked concrete C20/25 to C50/60 both for hammer drilled and diamond cored holes
- Highly reliable and safe anchor for seismic design with ETA C1/C2 approval. Seismic C1 ETA available even for Diamond cored holes.
- Clean and fast installation that suits hard jobsite conditions
- Suitable for dry and water saturated concrete
- High loading capacity
- Short curing time

Seismic resistance

All data in this section applies to:

- Hammer drilled holes and hammer drilled holes with hollow drill bit
- Correct setting (See setting instructions)
- No edge distance and spacing influence
- *Steel* failure
- Minimum base material thickness
- Concrete C20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- $\alpha_{gap} = 0,5$ if no clearance hole was filled
- Temperature range I: $-40 \text{ }^\circ\text{C}$ to $+40 \text{ }^\circ\text{C}$
(max. long term temperature $+24 \text{ }^\circ\text{C}$ and max. short term temperature $+40 \text{ }^\circ\text{C}$)

Setting information

Installation temperature range:

-10°C to +40°C for the standard variation of temperature and rapid variation of temperature after installation.

In service temperature range

Hilti HVU2 adhesive may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|-----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |
| Temperature range III | -40 °C to +120 °C | +72 °C | +120 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Curing time

| Temperature of the base material | Minimum curing time t_{cure} |
|----------------------------------|--------------------------------|
| -10 °C to -6 °C | 5 hours |
| -5 °C to -1 °C | 3 hours |
| 0 °C to 4 °C | 40 min |
| 5 °C to 9 °C | 20 min |
| 10 °C to 19 °C | 10 min |
| 20 °C to 40 °C | 5 min |

- a) Max. recommended torque moment to avoid splitting failure during installation with min. spacing and/or edge distance
- b) h : base material thickness ($h \geq h_{min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HVU2.

Hole drilling

Hammer drilled hole

For dry or wet concrete and installation in flooded holes (no sea water).

Hammer drilled hole with Hollow drill bit

For dry and wet concrete, only.
No cleaning required.

Diamond Coring

For dry or wet concrete only.

Hole cleaning

Manual cleaning for hammer drilled hole

for drill hole diameters $d_0 \leq 18$ mm and drill hole depths $h_0 \leq 10 \cdot d_0$.

Compressed air cleaning (CAC) for hammer drilled hole

for all drill hole diameters d_0 and all drill hole depths h_0 .

Hammer drilled flooded holes and diamond cored holes:

for all drill hole diameters d_0 and all drill hole depths h_0 .

Setting the element

Check setting depth.

Insert the foil capsule with the peak ahead to the back of the hole.

Drive the anchor rod with the plugged tool into the hole.

Overhead installation
For HVU2 M8 to M24.

Loading the anchor after required curing time t_{cure} .

Benefits

- Suitable for non-cracked and cracked ^{a)} concrete C 20/25 to C 50/60.
- Suitable for dry and water saturated concrete.
- Small edge distance and anchor spacing possible.
- High corrosion / corrosion resistant.
- In service temperature range up to 80°C short term / 50°C long term.

Setting information

Installation temperature range

-5°C to +40°C

In service temperature range

Hilti HIT-HY 170 injection mortar with anchor rod HIT-V may be applied in the temperature ranges given below. An elevated base material temperature leads to a reduction of the design bond resistance.

Temperature in the base material

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Curing and working time ^{a)}

| Temperature of the base material | Maximum working time t_{work} | Maximum curing time t_{cure} |
|---|------------------------------------|-----------------------------------|
| $-5\text{ °C} \leq T_{BM} \leq 0\text{ °C}$ ^{a)} | 10 min | 12 hours |
| $0\text{ °C} \leq T_{BM} \leq 5\text{ °C}$ ^{a)} | 10 min | 5 hours |
| $5\text{ °C} \leq T_{BM} \leq 10\text{ °C}$ | 8 min | 2,5 hours |
| $10\text{ °C} \leq T_{BM} \leq 20\text{ °C}$ | 5 min | 1,5 hours |
| $20\text{ °C} \leq T_{BM} \leq 30\text{ °C}$ | 3 min | 45 min |
| $30\text{ °C} \leq T_{BM} \leq 40\text{ °C}$ | 2 min | 30 min |

a) The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

| Critical edge distance for concrete cone failure ^{d)} | $c_{cr,N}$ [mm] | $1,5 h_{ef}$ | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced. $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)

- a) Maximum recommended torque moment to avoid splitting failure during instalation with minimum spacing and edge distance
- b) h : base material thickness ($h \geq h_{min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Brick types and properties

Instruction to this technical data

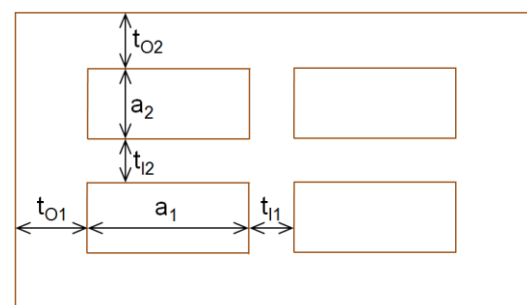

- Identify/choose your brick (or brick type) and its geometrical/physical properties on the following tables. Information about edge and spacing criteria for every brick is available on page 4.
- The pages referred on the last column of the table below contain the design resistance loads for pull-out failure of the anchor, brick breakout failure and local brick failure for each respective brick. Notice that the data displayed on these tables is only valid for single anchors with distance to edge equal to or greater than c_{cr} – for other cases not covered, use PROFIS Anchor software, consult ETA-15/0197 or contact Hilti Engineering Team.
- The resistance loads provided by this technical data manual are valid only for exact same masonry unit (hollow bricks) or for units made of the same base material with equal or higher size and compressive strength (solid bricks). For other cases, on-site tests must be performed-please consult page 8.

Anchor installation parameters

Brick position:

- **Header (H):** The longest dimension of the brick represents the width of the wall
- **Stretcher (S):** The longest dimension of the brick represents the length of the wall

Spacing and edge distance:

- c - Distance to the edge
- s_{||} - Spacing parallel to the horizontal joint
- s_⊥ - Spacing perpendicular to the horizontal joint

Minimum and characteristic spacing and edge distance parameters

- c_{min} - Minimum edge distance
- c_{cr} - Characteristic edge distance
- s_{min ||} - Min. spacing distance parallel to the bed joint
- s_{cr ||} - Characteristic spacing distance parallel to the bed joint
- s_{min ⊥} - Min. spacing distance perpendicular to the bed joint
- s_{cr ⊥} - Characteristic spacing distance perpendicular to the bed joint

Allowed anchor positions:

$$c \geq c_{cr} = c_{min}$$

$$c \geq c_{cr} = c_{min}$$

- This FTM includes the load data for single anchors in masonry with a distance to edge equal to or greater than the characteristic edge distance.

Design

- Anchorages are designed under the responsibility of an engineer experienced in anchorages and masonry work.
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings (e.g. position of the anchor relative to supports, etc.).
- Anchorages under static or quasi-static loading are designed in accordance with: ETAG 029, Annex C, Design method A.

Basic loading data (for a single anchor)

The load tables provide the design resistance load for a single loaded anchor.

All data in this section applies to:

- Edge distance $c \geq c_{cr} = c_{min}$.
- Correct anchor setting (see instruction for use, setting details)

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Pull-out of the anchor: $N_{Rd,p}$
- Brick breakout failure: $N_{Rd,b}$
- Pull out of one brick $N_{Rd,pb}$

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Local brick failure: $V_{Rd,b}$
- Pushing out of one brick: $V_{Rd,pb}$

Design tension and shear resistances – Pull out and pushing out of one brick failures

Pull out of one brick (tension):

$$N_{Rd,pb} = 2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) / (2,5 \cdot 1000) \text{ [kN]}$$

$$N_{Rd,pb}^* = (2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) + b \cdot h \cdot f_{vko}) / (2,5 \cdot 1000) \text{ [kN]}$$

* this equation is applicable if the vertical joints are filled

Pushing out of one brick (shear):

$$V_{Rd,pb} = 2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) / (2,5 \cdot 1000) \text{ [kN]}$$

σ_d = design compressive stress perpendicular to the shear (N/mm²)
 f_{vko} = initial shear strength according to EN 1996-1-1, Table 3.4

| Brick type | Mortar strength | f_{vko} [N/mm ²] |
|-----------------|-----------------|--------------------------------|
| Clay brick | M2,5 to M9 | 0,20 |
| | M10 to M20 | 0,30 |
| All other types | M2,5 to M9 | 0,15 |
| | M10 to M20 | 0,20 |

On-site test

For other bricks in solid or hollow masonry, not covered by the Hilti HIT-HY 170 ETA or this technical data manual, the characteristic resistance may be determined by on-site tension tests (pull-out tests or proof-load tests), according to ETAG029, Annex B.

For the evaluation of test results, the characteristic resistance shall be obtained taking into account the β factor, which considers the different influences of the product.

The β factor for the brick types covered by the Hilti HIT-HY 170 ETA is provided in the following table:

| Use categories | | w/w and w/d | | d/d | |
|-------------------------------------|-----------------|-------------|------|------|------|
| Temperature range | | Ta* | Tb* | Ta* | Tb* |
| Base material | Elements | | | | |
| Solid clay brick | HIT-V or HIT-IC | 0,97 | 0,83 | 0,97 | 0,83 |
| | HIT-V + HIT-SC | | | | |
| | HIT-IC + HIT-SC | | | | |
| Solid calcium silicate brick | HIT-V or HIT-IC | 0,96 | 0,84 | 0,97 | 0,84 |
| | HIT-V + HIT-SC | 0,69 | 0,62 | 0,91 | 0,82 |
| | HIT-IC + HIT-SC | | | | |
| Hollow clay brick | HIT-V + HIT-SC | 0,97 | 0,83 | 0,97 | 0,83 |
| | HIT-IC + HIT-SC | | | | |
| Hollow calcium silicate brick | HIT-V + HIT-SC | 0,69 | 0,62 | 0,91 | 0,82 |
| | HIT-IC + HIT-SC | | | | |
| Hollow lightweight concrete brick | HIT-V + HIT-SC | 0,89 | 0,81 | 0,97 | 0,86 |
| | HIT-IC + HIT-SC | | | | |
| Hollow normal weight concrete brick | HIT-V + HIT-SC | 0,97 | 0,80 | 0,97 | 0,80 |
| | HIT-IC + HIT-SC | | | | |

*Ta / Tb, w/w and d/d anchorage parameters, as defined on Tables pages 8-9

Applying the β factor from the table above, the characteristic tension resistance N_{Rk} can be obtained. Characteristic shear resistance V_{Rk} can also be directly derived from N_{Rk} . For detailed procedure consult ETAG 029, Annex B.

Base materials:

- Solid brick masonry. The characteristic resistances are also valid for larger brick sizes and larger compressive strengths of the masonry unit.
- Hollow brick masonry
- Mortar strength class of the masonry: M2,5 at minimum according to EN 998-2: 2010.
- For other bricks in solid masonry and in hollow or perforated masonry, the characteristic resistance of the anchor may be determined by on-site tests according to ETAG 029, Annex B under consideration of the β -factor according to Table page 9.

Setting information

Installation temperature range:

-5°C to +40°C

In service temperature range

Hilti HIT-HY 170 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | -40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | -40 °C to + 80 °C | + 50 °C | + 80 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|------------------------------------|-----------------------------------|
| $-5\text{ °C} \leq T_{BM} \leq 0\text{ °C}$ ^{a)} | 10 min | 12 h |
| $0\text{ °C} \leq T_{BM} \leq 5\text{ °C}$ ^{a)} | 10 min | 5 h |
| $5\text{ °C} \leq T_{BM} \leq 10\text{ °C}$ | 8 min | 2,5 h |
| $10\text{ °C} \leq T_{BM} \leq 20\text{ °C}$ | 5 min | 1,5 h |
| $20\text{ °C} \leq T_{BM} \leq 30\text{ °C}$ | 3 min | 45 min |
| $30\text{ °C} \leq T_{BM} \leq 40\text{ °C}$ | 2 min | 30 min |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

a) Data valid for hollow bricks only

Setting information

Installation temperature

-5°C to +40°C

Service temperature range

Hilti HIT-HY 170 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|----------------------|---------------------------|--|---|
| Temperature range I | - 40 °C to + 40 °C | + 24 °C | + 40 °C |
| Temperature range II | - 40 °C to + 80 °C | + 50 °C | + 80 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material | Max. working time in which rebar can be inserted and adjusted t_{work} | Min. curing time before rebar can be fully loaded t_{cure} |
|---------------------------------------|--|--|
| -5 °C ≤ T_{BM} ≤ 0 °C ^{a)} | 10 min | 12 h |
| 0 °C ≤ T_{BM} ≤ 5 °C ^{a)} | 10 min | 5 h |
| 5 °C ≤ T_{BM} ≤ 10 °C | 8 min | 2,5 h |
| 10 °C ≤ T_{BM} ≤ 20 °C | 5 min | 1,5 h |
| 20 °C ≤ T_{BM} ≤ 30 °C | 3 min | 45 min |
| 30 °C ≤ T_{BM} ≤ 40 °C | 2 min | 30 min |

The curing time data are valid for dry base material only. In wet base material the curing times must be doubled.

| Critical edge distance for concrete cone failure ^{d)} | $c_{cr,N}$ [mm] | $1,5 h_{ef}$ | | | | | | | | | | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) Both given values for drill bit diameter can be used
- b) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- c) h : base material thickness ($h \geq h_{min}$)
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the same side.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-HY 170.

Hammer drilled hole

For dry and wet concrete.

Hammer drilled hole with Hollow Drilled Bit (HDB)

No cleaning required.

Manual cleaning (MC)

for drill diameters $d_0 \leq 20$ mm and drill hole depth $h_0 \leq 10 \cdot d$.

Compressed air cleaning (CAC)

for all drill hole diameters d_0 and drill hole depths $h_0 \leq 20 \cdot d$.

Injection system preparation.

Benefits

- Suitable for concrete C12/15 to C50/60
- Suitable for dry and water saturated concrete
- High loading capacity and fast cure
- High corrosion resistant
- For rebar diameters up to 25 mm
- Manual cleaning for drill hole sizes ≤ 20 mm and embedment depth $h_{ef} \leq 10d$
- Suitable for embedment depth up to 1000 mm depending on the rebar diameter

| Rebar EN 1992-1-1 | Bars and de-coiled rods class B or C with f_{yk} and k according to NDP or NCL of EN 1992-1-1 $f_{uk} = f_{tk} = k \cdot f_{yk}$ |

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 170: low displacements with long term stability, failure load after exposure above reference load.

Resistance to chemical substance

| Chemical substance | Comment | Resistance |
|--------------------|-----------------|------------|
| Sulphuric acid | 23°C | + |
| Alkaline medium | pH = 13,2, 23°C | + |

Installation temperature range

-5°C to +40°C

Service temperature range

Hilti HIT-HY 170 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|---------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting information

Installation temperature range:
0°C to +40°C

In service temperature range

Hilti HIT-HY MM+ injection mortar with anchor rods may be applied in the temperature ranges given below. An elevated base material temperature leads to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-------------------|---------------------------|--|---|
| Temperature range | -40 °C to + 40 °C | + 24 °C | + 40 °C |

Max. short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max. long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

| Temperature of the base material T | Working time t_{gel} | Minimum curing time $t_{cure}^{1)}$ |
|---------------------------------------|---------------------------|--|
| 0 °C | 10 min | 4 h |
| 0 °C < TBM < 5 °C | 10 min | 2.5 h |
| 5 °C < TBM ≤ 10 °C | 8 min | 1.5 h |
| 10 °C < TBM ≤ 20 °C | 5 min | 45 min |
| 20 °C < TBM ≤ 30 °C | 3 min | 30 min |
| 30 °C < TBM ≤ 40 °C | 2 min | 20 min |

1) The curing time data are valid for dry base material only. In wet base material, the curing times must be doubled.

Setting information

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-1 / HIT-1 CE injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time:

| Temperature of the base material T_{BM} | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|---------------------------------|--------------------------------|
| $-5^{\circ}\text{C} \leq T_{BM} < 0^{\circ}\text{C}$ | 1,5 h | 6 h |
| $0^{\circ}\text{C} \leq T_{BM} < 5^{\circ}\text{C}$ | 45 min | 3 h |
| $5^{\circ}\text{C} \leq T_{BM} < 10^{\circ}\text{C}$ | 25 min | 2 h |
| $10^{\circ}\text{C} \leq T_{BM} < 15^{\circ}\text{C}$ | 20 min | 100 min |
| $15^{\circ}\text{C} \leq T_{BM} < 20^{\circ}\text{C}$ | 15 min | 80 min |
| $20^{\circ}\text{C} \leq T_{BM} < 30^{\circ}\text{C}$ | 6 min | 45 min |
| $30^{\circ}\text{C} \leq T_{BM} < 34^{\circ}\text{C}$ | 4 min | 25 min |
| $35^{\circ}\text{C} \leq T_{BM} < 40^{\circ}\text{C}$ | 2 min | 20 min |

Service temperature range

Hilti HIT-1 / HIT-1 CE injection mortar may be applied in the temperature ranges given below, An elevated base material temperature may lead to a reduction of the design bond resistance,

| Temperature range | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|----------------------|---------------------------|---|--|
| Temperature range I | -40 °C to +40 °C | +24 °C | +40 °C |
| Temperature range II | -40 °C to +80 °C | +50 °C | +80 °C |

Working time and curing time:

| Temperature of the base material | Maximum working time t_{work} | Minimum curing time t_{cure} |
|---|---------------------------------|--------------------------------|
| $0^{\circ}\text{C} \leq T_{BM} < 5^{\circ}\text{C}$ | 45 min | 3 h |
| $5^{\circ}\text{C} \leq T_{BM} < 10^{\circ}\text{C}$ | 25 min | 2 h |
| $10^{\circ}\text{C} \leq T_{BM} < 20^{\circ}\text{C}$ | 15 min | 100 min |
| $20^{\circ}\text{C} \leq T_{BM} < 30^{\circ}\text{C}$ | 6 min | 45 min |
| $30^{\circ}\text{C} \leq T_{BM} < 40^{\circ}\text{C}$ | 2 min | 25 min |

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-1 / HIT-1 CE.

Benefits

- Chemical injection fastening for the most common types of base materials:
- Hollow and solid clay bricks, calcium silicate bricks, normal and light weight concrete blocks
- Two-component hybrid mortar
- Versatile and convenient handling with HDE dispenser
- Flexible setting depth and fastening thickness
- Small edge distance and anchor spacing
- Suitable for overhead fastenings

Brick types and properties

Instruction to this technical data

- Identify/choose your brick (or brick type) and its geometrical/physical properties on the following tables. Information about edge and spacing criteria is available on page 5.
 - The pages referred on the last column of the table below contain the design resistance loads for pull-out failure of the anchor, brick breakout failure and local brick failure for each respective brick. Notice that the data displayed on these tables is only valid for single anchors with distance to edge such that loading capacity is not influenced by it – for other cases not covered, use PROFIS Engineering software, consult ETA-13/1036, ETA-19/0160 or contact Hilti Engineering Team.
- The resistance loads provided by this technical data manual are valid only for exact same masonry unit (hollow bricks) or for units made of the same base material with equal or higher size and compressive strength (solid bricks). For other cases, on-site tests must be performed-please consult page 18.

Anchor installation parameters

Brick position:

- **Header (H):** The longest dimension of the brick represents the width of the wall
- **Stretcher (S):** The longest dimension of the brick represents the length of the wall

Spacing and edge distance:

- c - Distance to the edge
- s_{||} - Spacing parallel to the bed joint
- s_⊥ - Spacing perpendicular to the bed joint

Allowed anchor positions:

- This FTM includes the load data for single anchors in masonry with a distance to edge equal to or greater than c^* .
- c^* is the distance from the anchor to the edge of the wall, such that the loading capacity of the anchor is not influenced by the edge.
- Minimum spacing between anchors = MAX ($3 \times h_{ef}$; size of brick in respective direction). This applies for a (conservative) manual design/calculation of a baseplate using the load tables in this manual.
- For an optimized design or cases not covered in this technical data, including anchor groups, please use PROFIS Engineering software or consult ETA-13/1036.

PROFIS Engineering software interface:

Design

- Anchorages are designed under the responsibility of an engineer experienced in anchorages and masonry work.
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings (e.g. position of the anchor relative to supports, etc.).
- Anchorages under static or quasi-static loading are designed in accordance with: EOTA TR054, Design method A

Basic loading data (for a single anchor)

The load tables provide the design resistance values for a single loaded anchor.

All data in this section applies to

- Edge distance $c \geq c^*$. For other applications, use Hilti PROFIS Engineering software.
- Correct anchor setting (see instruction for use, setting details)

Design – Failure modes

The design tensile resistance is the lower value of:

| Failure due to tension loads | | Condition |
|--------------------------------|--|--|
| Failure of the metal part | | $N_{Sd}^h \leq N_{Rd,s} = N_{Rk,s} / \gamma_{Ms}$ |
| Pull-out failure of the anchor | | $N_{Sd}^h \leq N_{Rd,p} = N_{Rk,p} / \gamma_{Mm}$ |
| Brick breakout failure | | $N_{Sd} \leq N_{Rd,b} = N_{Rk,b} / \gamma_{Mm}$ $N_{Sd}^g \leq N_{Rd}^g = N_{Rk}^g / \gamma_{Mm}$ |
| Pull out of one brick | | $N_{Sd} \leq N_{Rd,pb} = N_{Rk,pb} / \gamma_{Mm}$ |

The design shear resistance is the lower value of:

| Failure due to shear loads | | Condition |
|----------------------------|--|--|
| Failure of the metal part | | $V_{Sd}^h \leq V_{Rd,s} = V_{Rk,s} / \gamma_{Ms}$ |
| Local brick failure | | $V_{Sd} \leq V_{Rd,b} = V_{Rk,b} / \gamma_{Mm}$ $V_{Sd}^g \leq V_{Rd}^g = V_{Rk}^g / \gamma_{Mm}$ |
| Brick edge failure | | $V_{Sd} \leq V_{Rd,c} = V_{Rk,c} / \gamma_{Mm}$ $V_{Sd}^g \leq V_{Rd}^g = V_{Rk}^g / \gamma_{Mm}$ |
| Pushing out of one brick | | $V_{Sd} \leq V_{Rd,pb} = V_{Rk,pb} / \gamma_{Mm}$ |

- Notice that loads are affected by a series of factors such as visibility/filling of joints, factors for anchor groups, spacing and edge distance.
- For other applications not covered in this FTM, use Hilti PROFIS Engineering software.

Design tension and shear resistance – Pull out / Pushing out of one brick failure modes
Pull out of one brick (tension):

$$N_{Rd,pb} = 2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) / (2,5 \cdot 1000) \quad [\text{kN}]$$

$$N_{Rd,pb} = (2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) + b \cdot h \cdot f_{vko}) / (2,5 \cdot 1000) \quad [\text{kN}]$$

* this equation is applicable if the vertical joints are filled

Pushing out of one brick (shear):

$$V_{Rd,pb} = 2 \cdot l \cdot b \cdot (0,5 \cdot f_{vko} + 0,4 \cdot \sigma_d) / (2,5 \cdot 1000) \quad [\text{kN}]$$

 σ_d = design compressive stress perpendicular to the shear (N/mm²)
 f_{vko} = initial shear strength according to EN 1996-1-1, Table 3.4

| Brick type | Mortar strength | f_{vko} [N/mm ²] |
|-----------------|-----------------|--------------------------------|
| Clay brick | M2,5 to M9 | 0,20 |
| | M10 to M20 | 0,30 |
| All other types | M2,5 to M9 | 0,15 |
| | M10 to M20 | 0,20 |

On-site tests

For other bricks in solid or hollow masonry, not covered by the Hilti HIT-HY 270 ETA or this technical data manual, the characteristic resistance may be determined by on-site tension tests (pull-out tests or proof-load tests), according to EOTA TR053.

For the evaluation of test results, the characteristic resistance may be obtained taking into account the β factor, which considers the different influences of the product.

The β factor for the brick types covered by the Hilti HIT-HY 270 ETA is provided on the following table:

| Use categories | | w/w and w/d | | d/d | |
|---|----------|-------------|------|------|------|
| Temperature range | | Ta* | Tb* | Ta* | Tb* |
| Base material | Cleaning | | | | |

| Hollow normal weight concrete brick EN 771-3 | CAC/MC | 0,96 | 0,80 | 0,96 | 0,80 |

*Ta / Tb, w/w and d/d anchorage parameters, as defined on Table page 9

Applying the β factor from the table above, the characteristic tension resistance N_{RK} can be obtained. Characteristic shear resistance V_{RK} can also be directly derived from N_{RK} . For detailed procedure consult EOTA TR053.

Base materials:

- Solid brick masonry. The resistances are also valid for larger brick sizes and larger compressive strengths of the masonry unit.
- Hollow brick masonry
- Mortar strength class of the masonry: M2,5 at minimum according to EN 998-2: 2010.
- For other bricks in solid masonry and in hollow or perforated masonry, the characteristic resistance of the anchor may be determined by on-site tests according to EOTA TR053 under consideration of the β -factor according to the table on page 21.

a) Installation without the sieve sleeve HIT-SC can be used only in case of solid bricks.

Setting instructions

*For detailed information on installation see instruction for use given with the package of the product.

Safety regulations.

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling! Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-HY 270.

Drilling

In hollow bricks: rotary mode

In solid bricks: hammer mode

Cleaning

Manual cleaning (MC)

For drill hole diameter $d_0 \leq 18$ mm and drill hole depth $h_0 \leq 100$ mm

Compressed air cleaning (CAC)

For drill hole depth $h_0 \leq 300$ mm

Injection preparation for hollow and solid bricks with sieve sleeve

Close lid and insert sieve sleeve manually.

All applications

Injection system preparation.

Inject the adhesive without forming air voids

Injection method 1 for Installation with sieve sleeve HIT-SC. Use extension for installation with two sieve sleeves.

Injection method 2 for installation in solid bricks without sieve sleeve

Setting de element

Marking and setting element, to the required embedment depth, observing working time t_{work} .

Loading the anchor: After required curing time t_{cure} the anchor can be loaded. The applied installation torque shall not exceed the values T_{max} .

HDA Undercut anchor

Ultimate-performance undercut anchor for dynamic loads

HDA-PF
Anchor for
pre-setting
(M10-M20)

HDA-T
HDA-TR
HDA-TF
Anchor for
through-fastening
(M10-M20)

Benefits

- Safe and high performance structural seismic design with ETA C1 and C2
- Mechanical interlock (undercut)
- Low expansion force (thus small edge distance / spacing)
- Self undercutting (without special undercutting tool)
- Performance of a headed stud
- Complete system (anchor, stop drill bit, setting tool, drill hammer)
- Setting mark on anchor for control (easy and safe)
- Completely removable

a) HDA M20: only a galvanized 5 μ m version is available

b) The recommended bending moment of the HDA anchor bolt may be calculated from $M_{rec} = M_{Rd,s} / \gamma_F = M_{Rk,s} / (\gamma_{Ms} \cdot \gamma_F) = (1,2 \cdot W_{el} \cdot f_{uk}) / (\gamma_{Ms} \cdot \gamma_F)$, where the partial safety factor for bolts of strength 8.8 is $\gamma_{Ms} = 1,25$, for A4-80 equal to 1,33 and the partial safety factor for action may be taken as $\gamma_F = 1,4$. In case of HDA-T/TR/TF the bending capacity of the sleeve is neglected, only the capacity of the bolt is taken into account.

| Critical edge distance for concrete cone failure $C_{cr,N}$ [mm] | 150 | 190 | | 285 | | 375 | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Stop drill bit HDA

The stop drill is required for drilling in order to achieve the correct hole depth.

The setting system (tool and setting tool) is required for transferring the specific energy for the undercutting process.

| Critical edge distance for splitting failure | $c_{cr,sp}$ [mm] | 115 | 150 | 160 | 200 |
| Critical spacing for concrete cone failure | $s_{cr,N}$ [mm] | 180 | 240 | 300 | 375 |
| Critical edge distance for concrete cone failure | $c_{cr,N}$ [mm] | 90 | 120 | 150 | 188 |

In case of smaller edge distance and spacing than $c_{cr,sp}$, $s_{cr,sp}$, $c_{cr,N}$ and $s_{cr,N}$ the load values shall be reduced according ETAG 001, Annex C.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete.

For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

| Critical edge distance for concrete cone failure | $c_{cr,N}$ [mm] | 60 | 60 | 75 | 90 | 90 |

In case of smaller edge distance and spacing than $c_{cr,sp}$, $s_{cr,sp}$, $c_{cr,N}$ and $s_{cr,N}$ the load values shall be reduced according ETAG 001, Annex C

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete.

For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

| Anchor versions | | Benefits |
|-----------------|--|---|
| | | <ul style="list-style-type: none"> - Suitable for cracked concrete C20/25 to C50/60 - Suitable for all dynamic loads: seismic C1 and C2, shock and fatigue - Can be installed with hammer or diamond drilling for same performance - Top shear performance due to high strength expansion and shear sleeves - Automatic torque control with HSL-3-B - Length can be customized to a specific project need - Easily removable for temporary fastening or retrofit |

Seismic resistance (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube}=25 \text{ N/mm}^2$
- $\alpha_{gap} = 0,5$

| Anchor versions | | Benefits |
|-----------------|--|---|
| | | <ul style="list-style-type: none"> - Suitable for cracked concrete C20/25 to C50/60 - Suitable for seismic C1 and C2, shock, fire and fatigue - Installation with hammer drilling, diamond drilling and hollow drill bit available for same performance - Top shear performance due to high strength expansion and shear sleeves - HSL4-B special safety cap ensures proper installation torque even without calibrated torque wrench - Tracefast improves quality assurance of anchor installation by making every fastener uniquely identifiable and allowing easy documentation - Easily removable for temporary and machine fastening applications or retrofit needs |

a) All data given in this section according to ETA-98/0001, issue 2021-05-04.

* ETA-98/0001 covers the concrete strength class between C20/25 and C 50/60. Strength classes out of this interval are covered by Hilti Technical Data

Static and quasi-static loading (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cyl} = 20 \text{ N/mm}^2$ (EN 1992-4 design)

Fire resistance

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- *Steel* failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cyl} = 20 \text{ N/mm}^2$ (EN 1992-4 design)
- Hilti technical data for concrete strength class C55/67 to C80/95: for a structural element that fullfills the requirements according to DIN EN 1992-1-2 the fire resistance of C20/25 could be assumed.
- partial safety factor for resistance under fire exposure $\gamma_{M,fi}=1,0$ (in absence of other national regulations)

* ETA-98/0001 provides flexible edge & spacing values for each anchor layout configuration depending on base material thickness. Minimum spacing and edge distance values on the table are recommendations for specific anchor layout and base material dimensions. We kindly ask you to check your designs on PROFIS Engineering software to verify the edge & spacing values.

Setting instruction

Hammer drilling

1. Drill the hole

2. Clean the hole

3a. Insert the anchor with hammer

3a. Insert the anchor with setting tool HS-SC (M8-M16)

4. Check

5a. Torque with calibrated torque wrench (M8-M16)

5b. Torque with impact wrench with Adaptive torque module (M8-M12)

Hollow Drill Bit, no cleaning required

1. Drill the hole with the Hollow drill bit

2a. Insert the anchor with hammer

2a. Insert the anchor with setting tool HS-SC

3. Check

4a. Torque with calibrated torque wrench (M8-M16)

4b. Torque with impact wrench with Adaptive torque module (M8-M12)

Diamond coring

1. Core the hole

2. Flushing

3. Clean the hole

4a. Insert the anchor with hammer

4b. Insert the anchor with setting tool HS-SC (M8-M16)

5. Check

6a. Torque with calibrated torque wrench (M8-M16)

6b. Torque with impact wrench with Adaptive torque module (M8-M12)

Benefits

- Fast & convenient setting behaviour
- Reliable ETA approved torquing using impact wrench with the innovative SIW 6AT-A22 and SI-AT-A22 system for automatic torquing
- Small edge and spacing distances
- High loads
- Three embedment depths for maximal design flexibility
- M10, M12, M16 and M20 ETA approved for diamond cored holes using DD 30-W and matching diamond core bit
- Suitable for pre- and through fastening
- Long lengths available suitable for wood structures fastening applications

| Description | Authority / Laboratory | No. / date of issue |
|---|------------------------|--------------------------|
| European technical assessment ^{a)} | DIBt, Berlin | ETA-11/0374 / 2020-10-22 |

a) All data given in this section according to ETA-11/0374, issued 2020-10-22.

Static and quasi-static loading (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- **Steel** failure
- Minimum base material thickness
- Concrete C 20/25

HSV Expansion anchor

Economical expansion anchor for uncracked concrete

Anchor version

HSV (F)
(M8-M16)

HSV-BW
(M8-M16)

Benefits

- Torque-controlled mechanical expansion allows immediate load application
- Setting mark
- Cold-formed to prevent breaking during installation
- Raised impact section prevents thread damage during installation
- Drill bit size is same as anchor size for easy installation.

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- *Steel* failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

HUS4 Screw anchor

Ultimate performance screw anchor for single point fastening

| Anchor version | | Benefits |
|---|----------------------|--|
|  | HUS4-H(F) (8-16)* | - High productivity - less drilling and fewer operations than with conventional anchors |
|  | HUS4-C (8-10) | - ETA approval for cracked and non-cracked concrete - ETA approval for Seismic C1 and technical data for C2 |
|  | HUS4-A(F) (10-14) | - ETA approval for adjustability (unscrew-rescrew) - Smaller edge and spacing distance - abZ (DIBt) approval for reusability in fresh concrete ($f_{ck, cube} = 10/15/20/25 \text{ Nmm}^2$) for temporary applications - Three embedment depths for maximum design flexibility and flexible design for concrete cone capacity - No cleaning required size 8 to 14 - HUS4-HF and HUS4-AF with multilayer coatings for additional corrosion protection - Through fastening with H, A and C head - Pre-fastening with A head |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Basic loading data for temporary application in standard and fresh concrete <28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according to Hilti instruction for use with the suited tube Hilti HRG
- Design resistance is valid for single anchor only
- Design resistance is valid for all load directions and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence
- Valid for HUS4-H and HUS4-A
- All data in this section are according to DIBt approval Z-21.8-2137 issue 2021-12-21

Basic loading data (for a single anchor) in solid masonry units

All data in this section applies to:

- Load values valid for holes drilled with TE rotary hammers (without hammering for PPW)
- Correct anchor setting (see instruction for use, setting details)
- Recommended setting machine: SIW 6AT-A
- The ratio of hollow or holes space to solid may not exceed 15 % of a bed joint area
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below

Permissible anchor location in brick and block walls

Edge distance and spacing influence

- The technical data for HUS4 anchors are reference loads for MZ 12, KS 12, Vbl 6, PPW 6 and Leca5®. Due to the large variation of natural stone slid bricks, on site anchor testing is recommended to validate technical data
- The HUS4 anchor was installed and tested in center of solid bricks as shown. The HUS4 anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected
- For brick walls where anchor position in brick can not be determined, 100 % anchor testing is recommended
- Distance to free edge free edge to solid masonry (Mz, KS and light weight concrete) units $\geq 200\text{mm}$
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units $\geq 170\text{mm}$
- The minimum distance to horizontal and vertical mortar joint (c_{\min}) is started in drawing below
- Minimum anchor spacing (s_{\min}) in one brick/block is $\geq 80\text{ mm}$

Limits

- All data is for multiple use for non-structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth
- The decisive resistance to tension loads is the lower value of N_{rec} (brick breakout, pull out) and $N_{\text{max,pb}}$ (pull out of one brick)

Installation in Hollow core slabs - example size 10

Basic loading data for single anchor in pre-stressed Hollow core slab (HCS) for temporary fastening

All data in this section applies to

- Correct setting (see setting instruction)
- Verification of wear of the screw with HUS HRG check gauge is needed

- No edge distance and spacing influence
- Ratio core width / web thickness $w/e \leq 5,3$
- Concrete C30/37 to C50/60, uncracked

Installation position for temporary fastening in HCS:

- Top position of the slab is allowed.
- Anchor to be installed within area of ± 10 mm of the thickest section of the solid part.

HUS4-MAX Bonded screw anchor

Ultimate performance screw anchor for single point fastening

| Anchor version | | Benefits |
|---|--------------------------|---|
|  | HUS4-H(F) (10-14)* | - High productivity - less drilling and fewer operations than with conventional anchors |
|  | HUS4-C (10) | - ETA approval for cracked and non-cracked concrete - ETA approval for Seismic C1 and technical data for C2 |
|  | HUS4-A(F) (10 and 14) | - ETA approval for adjustability (unscrew-rescrew) |
|  | HUS4-MAX capsule | - Smaller edge and spacing distance - One embedment at the level of h.nom3 of HUS4 for maximum performance - No cleaning allowed size 10 to 14 - HUS4-HF and HUS4-AF with multilayer coatings for additional corrosion protection - Through fastening with H, A and C head - Pre-fastening with A head |

| Critical spacing for concrete cone failure $s_{cr,N}$ [mm] | 3 h_{ef} | | |
| Critical edge distance for concrete cone failure $c_{cr,N}$ [mm] | 1,5 h_{ef} | | |

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Storage and transport temperature range:

-20°C to +25°C

Temperature in the base material:

at installation

-10 °C to +40 °C

in-service

Temperature range I: -40 °C to +120 °C

(max. long term temperature +72 °C and max. short term temperature +120 °C)

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time

| Critical edge distance for concrete cone failure | $c_{cr,N}$ [mm] | 1,5 h_{ef} | | | | | | | | | | |

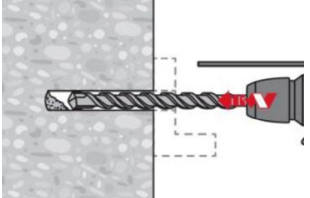

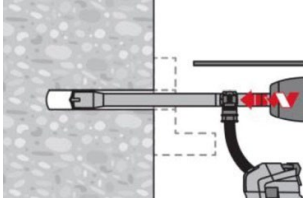

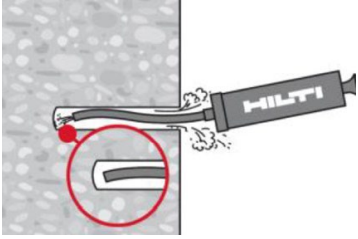

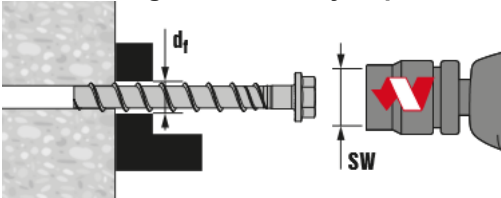

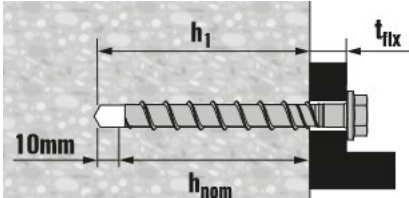

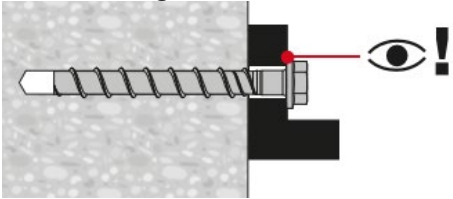

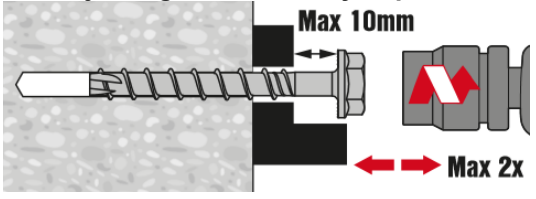

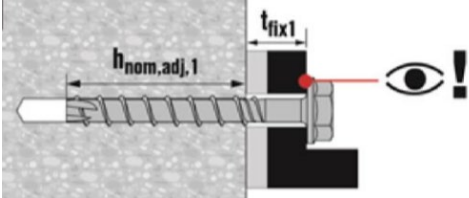

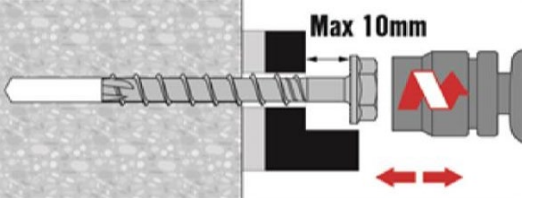

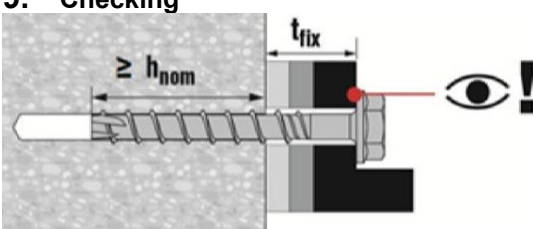

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

The anchor can be adjusted max. two times.

The total allowed thickness of shims added during the adjustment process is 10 mm.

The final embedment depth after adjustment process must be larger or equal than h_{nom2} or h_{nom3}.

For size 14 only, hole cleaning is not required under specific conditions. Check instructions for use for more information.

Basic loading data for temporary application in standard and fresh concrete <28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according to Hilti instruction for use with the suited tube Hilti HRG
- Design resistance and recommended loads are valid for single anchor only
- Design resistance as well as recommended loads are valid for all load directions and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence
- Valid for HUS3-H only
- All data in this section for sizes 10 and 14 according to DIBt approval Z-21.8.2018 issue 2014-04-01
- All data in this section for size 8 according to Hilti Technical Data

Basic loading data (for a single anchor) in solid masonry units

All data in this section applies to:

- Load values valid for holes drilled with TE rotary hammers in hammering mod
- Correct anchor setting (see instruction for use, setting details)
- The core/material ratio may not exceed 15 % of a bed joint area
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below
- All data given in this section according to Hilti Technical Data

Permissible anchor location in brick and block walls

Edge distance and spacing influence

- The technical data for HUS3 anchors are reference loads for MZ 12, KS 12 and PPW 6. Due to the large variation of natural stone slid bricks, on site anchor testing is recommended to validate technical data
- The HUS3 anchor was installed and tested in center of solid bricks as shown. The HUS3 anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected
- For brick walls where anchor position in brick can not be determined, 100 % anchor testing is recommended
- Distance to free edge free edge to solid masonry (Mz and KS) units ≥ 200mm
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units ≥ 170mm
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is started in drawing below
- Minimum anchor spacing (s_{min}) in one brick/block is ≥ 80 mm

Limits

- All data is for multiple use for non-structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth
- The decisive resistance to tension loads is the lower value of N_{rec} (brick breakout, pull out) and $N_{max,pb}$ (pull out of one brick)

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Basic loading data (for a single anchor) in solid masonry units

All data in this section applies to:

- Load values valid for holes drilled with TE rotary hammers in hammering mod
- Correct anchor setting (see instruction for use, setting details)
- The core/material ratio may not exceed 15 % of a bed joint area
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below
- All data given in this section according to Hilti Technical Data

Permissible anchor location in brick and block walls

Edge distance and spacing influence

- The technical data for HUS-HR anchors are reference loads for MZ 12 and KS 12. Due to the large variation of natural stone solid bricks, on site anchor testing is recommended to validate technical data
- The HUS-HR anchor was installed and tested in center of solid bricks as shown. The HUS-HR anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected
- For brick walls where anchor position in brick can not be determined, 100 % anchor testing is recommended
- Distance to free edge free edge to solid masonry (Mz and KS) units $\geq 170\text{mm}$
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units $\geq 170\text{mm}$
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is started in drawing below
- Minimum anchor spacing (s_{min}) in one brick/block is $\geq 2 \cdot c_{min}$

Limits

- Applied load to individual bricks may not exceed 1,0 kN without compression or 1,4 kN with compression
- All data is for multiple use for non-structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the EAD 330747 § 1.2.1. In Absence of a definition by a Member State the following default values may be taken.

| Minimum number of fixing points | Minimum number of anchors per fixing point | Maximum design load of action N_{Sd} per fixing point ^{a)} |
|---------------------------------|--|---|
| 3 | 1 | 2 kN |
| 4 | 1 | 3 kN |

a) The value for maximum design load of actions per fastening point N_{Sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{Sd} may be increased if the failure of one (=most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Setting instruction for HUS-HR,CR

1. Drill hole with the drill bit

2. Clean hole

3. Installing the anchor by impact screw driver

4. Checking

Setting instruction for HUS3-H, C, I, I-Flex, A, P, PS

1. Drill hole with drill bit

2. Clean hole

3. Installing the anchor by impact screw driver

4. Checking

The anchor can be adjusted max. two times.

The total allowed thickness of shims added during the adjustment process is 10 mm.

The final embedment depth after adjustment process must be larger or equal than h_{nom2} or h_{nom3} .

Basic loading data for redundant fastening in prestressed hollow core slabs

All data in this section applies to:

- Correct anchor setting (See setting instruction)
- No edge distance and spacing influence
- Ratio core width/web thickness $w/e \leq 4,2$
- Concrete C 30/37 to C50/56
- Data for size 6 is according to ETA-10/0005
- Data for size 8 and 10 is according to Hilti technical data

HUS2-H Screw anchors

Premium screw anchor for use in concrete with hex head

Anchor version

HUS2-H
(8-10)

Benefits

- High productivity- less drilling and fewer operations than with conventional anchors
- Suitable for cracked and non-cracked concrete C20/25
- ETA approval for cracked and non-cracked concrete
- Technical data for reusability in fresh concrete ($f_{ck,cube} = 10/15/20 \text{ Nmm}^2$) for temporary applications
- Two embedment depths for maximum design flexibility

Basic loading data for temporary application in standard & fresh concrete < 28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$:

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according Hilti instruction for use with the suited tube Hilti HRG D=8,10,14 MM
- Design resistance and recommended load are valid for single anchor only
- Design resistance as well as the recommended load are valid for all load direction and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence

Basic loading data (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- **Steel** failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Applied loads to individual bricks/blocks without compression may not exceed 1,0 kN
- Applied loads to individual bricks/blocks with compression may not exceed 1,4 kN
- Data applies only to bricks/blocks, there is no test data available for loads in mortar joints. Hilti recommends at least 50% load reduction or on site testing, if the location of the anchor in relation to the joint can not be specified because of wall plaster or insulation.
- Plaster, gravelling, lining or levelling courses are regarded as non-bearing and may not be taken into account for calculation of embedment depth

Note:

When tightening the screw anchor in soft base materials and in hollow brick, care must be taken not to apply too much torque. If the screw anchor is over-tightened the fastening point is unusable for the HUS 6.

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1. In absence of a definition by a Member State the following default values may be taken.

| Minimum number of fixing points | Minimum number of anchors per fixing point | Maximum design load of action N_{Sd} per fixing point ^{a)} |
|---------------------------------|--|---|
| 3 | 1 | 2 kN |
| 4 | 1 | 3kN |

a) The value for maximum design load of actions per fastening point N_{Sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{Sd} may be increased if the failure of one (=most unfavorable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Anchor version

HKV
(M6-M16)

Benefits

- Simple and well proven
- Approved, tested and confirmed by every day jobsite experience
- Reliable setting thanks to simple visual check
- Versatile
- For medium-duty fastening with bolts or threaded rods
- Available in various materials and sizes for maximized coverage of possible applications

Base material

Concrete
(non-cracked)

Basic loading data (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Screw or rod with steel grade 5.8 (carbon steel) and / or A4-70 (stainless steel)

Service temperature range

Hilti HRD frame anchors may be applied in the temperature range given below.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-------------------|---------------------------|--|---|
| Temperature range | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

a) For spacing larger than the critical spacing each anchor in a group can be considered in design

b) For edge distance smaller than critical edge distance the design loads

c) Linear interpolation allowed

d) Only for brick "Doppio Uni" and "Mattone"

e) Minimum base material thickness of masonry depends on brick type; see specification of brick types in the table above

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Setting information

Installation temperature

-10°C to +40°C

Service temperature range

Hilti HRV frame anchors may be applied in the temperature range given below.

| Temperature range | Base material temperature | Max. long term base material temperature | Max. short term base material temperature |
|-------------------|---------------------------|--|---|
| Temperature range | -40 °C to +80 °C | +50 °C | +80 °C |

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1. In Absence of a definition by a Member States the following default values may be taken.

| Minimum number of fixing points | Minimum number of anchors per fixing point | Maximum design load of action N_{sd} per fixing point ^{a)} |
|---------------------------------|--|---|
| 3 | 1 | 2 |
| 4 | 1 | 3 |

a) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{sd} may be increased if the failure of one (=most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Special case: Groups of $n=2$ and /or $n=4$ anchors with small spacing:

The basic loading data for a single anchor is valid for one fixing point.

Fixing point can be:

- Single anchors
- Groups of 2 anchors
With $s_1 \geq 60$ mm
- Groups of 4 anchors
With $s_1 \geq 100$ mm and $s_2 \geq 100$ mm

Requirements for multiple use

The definition of multiple use according to Member State is given in the ETAG 001 Part six, Annex 1. In absence of a definition by a Member State the following default values may be taken.

Basic loading data (for a single anchor) in solid masonry units

All data in this section applies to

- Load values valid for holes drilled with TE rotary hammers in hammering mode
- Correct anchor setting (see instruction for use, setting details)
- The core / material ratio may not exceed 15% of a bed joint area.
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below

a) Recommended load values for German base materials are based on national regulations.

b) f_b =brick strength

c) Values only valid for Mz(DIN 105) with brick strength $\geq 19 \text{ N/mm}^2$, density $2,0 \text{ kg/dm}^3$, min. brick size NF (24,0 cm x 11,5 cm x 11,5 cm)

d) Values only valid for KS(DIN 106) with brick strength $\geq 29 \text{ N/mm}^2$, density $2,0 \text{ kg/dm}^3$, min. brick size NF (24,0 cm x 11,5 cm x 11,5 cm)

Permissible anchor location in brick and block walls

Anchor position in Brick

Edge distance and spacing influences

- The technical data for the HLC sleeve anchors are reference loads for MZ 12 and KS 12. Due to the large variation of natural stone solid bricks, on site anchor testing is recommended to validate technical data.
- The HLC anchor was installed and tested in center of solid bricks as shown. The HLC anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected.
- For brick walls where anchor position in brick cannot be determined, 100% anchor testing is recommended.
- Distance to free edge free edge to solid masonry (Mz and KS) units ≥ 300 mm
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is stated in the drawing above.
- Minimum anchor spacing (s_{min}) in one brick/block is $\geq 2 \cdot c_{min}$

Limits

- Applied load to individual bricks may not exceed 1,0 kN without compression or 1,4 kN with compression
- All data is for multiple use for non-structural applications

Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth.

HAM Light duty metal anchors

Economical sleeve anchor

Anchor version

HAM
8.8 screw
(M6-M12)

HAM
(M6-M12)

Benefits

- Secure fastenings in various base materials
- Cone attached to sleeve to ensure pre-setting
- Wings to prevent spinning in the borehole
- Plastic cap in cone to prevent dust entrance
- Blue-chromate zinc coating
- 8.8 steel strength of screw

Base material

Concrete
(non-cracked)

Solid brick

Basic loading data (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- *Steel* failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

Setting instruction

*For detailed information on installation see instruction for use given with the package of the product.

Setting instruction

1. Insert the cone bolt by hammering it in, until setting tool touches surface.

2. Insert the expansion sleeve over the threaded rod.

3. Drive in the sleeve by hammering or with the machine setting tool.

4. Tighten the nut until the blue ring becomes visible.

Basic loading data

For temporary application:

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table

For temporary application in standard and fresh concrete < 28 days old:

All data in this section applies to:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according Hilti instruction for use with the suited tube Hilti HRG
- Design resistance are valid for single anchor only
- Design resistance are valid for all load direction and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence

HIF Insulation fastener

Anchor version

HIF

Benefits

- Especially for soft insulation material
- Plate diameter 90mm is ideal not to sink in the surface
- No slip-on plate must be used
- Drilling, hammering, done
- Speed due to less drilling effort
- With anchors up to 240mm insulation thickness the whole application is covered

In absence of national provisions, HTH can be used for ETICS with mineral wool if the following provision are kept:

- minimum 4 anchors/m²
- only ETICS fixed with anchors and supplementary adhesive
- only ETICS that hold an ETA or National approval
- Mineral wool of TR5 or greater
- Mineral wool of 100mm to 300mm thickness
- Rendering weight ≤ 48 kg/m²
- Characteristic pull-through resistance of the mineral wool in combination with HTH has to be determined by tests
- Design of anchor number/m² must be done based on characteristic pull-through resistance and pull-out resistance by an engineer experienced in anchor design

- b) The data are related to the performance of the helix-shaped insulation holder of HTH. The naming plate stiffness and plate capacity were kept because that is the common nomenclature.

Hilti HTH ETICS anchors may be applied in the temperature range given below.

Service temperature range

| | Base material temperature | Maximum long term base material temperature | Maximum short term base material temperature |
|-------------------|---------------------------|---|--|
| Temperature range | 0 °C to +40 °C | +24 °C | +40 °C |

Maximum short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Maximum long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

a) All data given in this section are - if not otherwise indicated - in accordance ETA-16/0116, issue 2018-03-28

Basic loading data for short term acting loads e.g. wind (for a single anchor)

All data in this section applies to:

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- Base material as specified in table
- Minimum base material thickness
- Transmission of wind suction loads only
- Redundant fastening in non-cracked concrete
- Anchor and its plate is not exposed to UV-radiation for more than 6 weeks

a) This technical data are not covered by ETA-16/0116. They are based on an HILTI-internal assessment of test data. Recommended values can be used in case that the insulation material to be fastened is not covered by a European Technical Assessment (ETA) or any national approval document. If the ETICS to be fastened is covered by an ETA or any national approval document, the given pull-through resistance in the ETA or national approval document is applicable. The design of anchorages has to be carried out in accordance to EAD 330196-01-0604 and ETAG 004 or EAD 040083-00-0404 or applicable national regulation under the responsibility of an engineer experienced in anchorages.

b) HILTI slip-on plate HDT 90 must be used

c) HILTI slip-on plate HDT 140 must be used

Basic provisions for dead loads on the bottom side of ceilings (for a single anchor)
All data in this section applies to

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table
- Minimum base material thickness
- Quasi-static permanent loads only
- Redundant fastening in non-cracked and cracked concrete
- Anchor and its plate is not exposed to UV-radiation for more than 6 weeks

Note: Pull-through resistance of panel and its bending resistance shall be proven by panel manufacturer or any other person experienced in the design of such panels. Drawings of fixing positions shall be provided to the operator. Each panel shall be fixed with 4 anchors at least.

Recommended number of anchors for fixing panels to ceilings w/o consideration of wind loads^{a)}:

| Specific panels weight | Number of anchors per m ² |
|------------------------|--------------------------------------|
| ≤ 29 kg/m ² | 4 |
| ≤ 43 kg/m ² | 6 |
| ≤ 57 kg/m ² | 8 |
| ≤ 71 kg/m ² | 10 |

a) This technical data are not covered by ETA-16/0116. They are based on an HILTI-internal assessment of test data. A safety factor for dead load $\gamma_F=1,35$ and a safety factor $\gamma_M=1,80$ for material is considered.
